Simon Deakin,Christopher Markou,2020-11-26 What does computable law mean for the autonomy authority and legitimacy of the legal system Are we witnessing a shift from Rule of Law to a new Rule of Technology Should we even build these things in the first place This unique volume collects original papers by a group of leading international scholars to address some of the fascinating questions raised by the encroachment of Artificial Intelligence AI into more aspects of legal process administration and culture Weighing near term benefits against the longer term and potentially path dependent implications of replacing human legal authority with computational systems this volume

pushes back against the more uncritical accounts of AI in law and the eagerness of scholars governments and LegalTech developers to overlook the more fundamental and perhaps bigger picture ramifications of computable law With contributions by Simon Deakin Christopher Markou Mireille Hildebrandt Roger Brownsword Sylvie Delacroix Lyria Bennet Moses Ryan Abbott Jennifer Cobbe Lily Hands John Morison Alex Sarch and Dilan Thampapillai as well as a foreword from Frank Pasquale    <u>Algorithms Unlocked</u> Zoe Codewell,AI,2025-01-13 Algorithms Unlocked offers a comprehensive journey through the fundamental principles of computational problem solving focusing on how computers efficiently tackle complex challenges The book masterfully breaks down three critical areas sorting algorithms for data organization searching techniques for information retrieval and optimization methods for finding optimal solutions What sets this book apart is its emphasis on understanding the why behind algorithms rather than just their implementation making it accessible to both beginners and experienced practitioners The book s progression is thoughtfully structured beginning with essential mathematical and computational foundations before advancing to more complex concepts Readers explore classical sorting algorithms like quicksort and merge sort delve into searching techniques such as binary and depth first search and discover optimization approaches through greedy algorithms and dynamic programming Each topic is presented with a balance of theoretical understanding and practical application supported by real world examples and performance analyses While the content maintains technical rigor it remains remarkably accessible through its tutorial style format and focus on algorithmic thinking rather than specific programming languages The book serves as both an educational resource and practical reference making it particularly valuable for computer science students software developers and professionals seeking to optimize their code Throughout its chapters readers gain insights into crucial concepts like algorithmic complexity efficiency trade offs and practical implementation considerations all while building a solid foundation in computational problem solving methods     **Critical Digital Humanities** James E Dobson,2019-03-16 Can established humanities methods coexist with computational thinking It is one of the major questions in humanities research today as scholars increasingly adopt sophisticated data science for their work James E Dobson explores the opportunities and complications faced by humanists in this new era Though the study and interpretation of texts alongside sophisticated computational tools can serve scholarship these methods cannot replace existing frameworks As Dobson shows ideas of scientific validity cannot easily nor should be adapted for humanities research because digital humanities unlike science lack a leading edge horizon charting the frontiers of inquiry Instead the methods of digital humanities require a constant rereading At the same time suspicious and critical readings of digital methodologies make it unwise for scholars to defer to computational methods Humanists must examine the tools including the assumptions that went into the codes and algorithms and questions surrounding their own use of digital technology in research Insightful and forward thinking Critical Digital Humanities lays out a new path of humanistic inquiry that merges critical theory and computational science     **Algorithms Unlocked** Elian Greystone,2025-08 Crack the

Sherwani,Qiong Yu,Sandeep Badida,1995-11-23 Advantages of MCMs over traditional packaging methods for electronic based applications in computers aviation and the military Introduction to Multichip Modules discusses both custom built MCMs and programmable MCMs and their role in reducing cost and improving turnaround time An invaluable resource for students and professionals in electrical engineering who design MCMs and MCM based systems and for those in computer science who develop CAD tools for MCMs this    **Restructuring Symbolic Programs for Concurrent Execution on Multiprocessors** James R. Larus,1989 CURARE the program restructurer described in this dessertation autmatically transforms a sequential Lisp program into an equivalent concurrent program that executes on a multiprocessor CURARE first analyzes a program to find its control and data dependences This analysis is most difficult for references to structures connected by pointers CURARE uses a new data dependence algorithm which finds and classifies these dependencies The a nalysis is conservative and may detect conflicts that do not arise in practice A programmer can temper adn refine its results with declarations Dependences constrain the program s concurrent execution because in general two conflicting statements cannot execute in a different order without affecting the program s result A restructerer must know all dependences in order to preserve them Howeve r not all dependences are essential to produce the program s result CURARE attempts to transform the program so it computes its result with fewer conflicts An optimized program will execute with less synchronization and more concurrency CURARE then examines loops in a program to find those that are unconstrained or lightly constrained by dependences By necessity CURARE treats recursive functions as loops and does not limit itself to explicit program loops Recursive functions offer se veral advantages over explicit loops since they provide a convenient framework for inserting locks and handling the dynamic behaviour of symbolic programs Loops that are suitable for concurrent execution are changed to execute on a set of concurrent serv er processes These servers execute single loop iterations and therefore need to be extremely inexpensive to invoke Restructured programs execute significantly faster than the original sequential programs This improvement is large

enough to attract programmers to a multiprocessor particularly since it requires little effort on their part Although restructured progra ms may not make optimal use of a multiprocessor s parallelism they make good use of a programmer s time      **Proceedings** ,2000      **Beginning to Unlock the Black Box in the HR Firm Performance Relationship** Timothy Michael Gardner,2001
