

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the cylinder, the combustion chamber and the valve in a cylinder or other component. These gaskets have a groove which distributes seal stress in a groove with an application on all three and high compressions used to increase the gasket. A gasket is used to maintain the pressure in a cylinder and to prevent leakage throughout the life cycle application. The gasket compresses to fill the irregularities between the mating surfaces of the cylinder. This is done by creating a seal between the gasket and the mating surfaces. The gasket is used to seal the mating surfaces. If the gasket mating surfaces are not perfectly aligned and compressed through the life of the application then a seal will be provided for a gasket.

In order to determine the application requirements, the gasket designer or engineer should determine the gasket requirements in advance. Every gasket application or design has its own requirements. The gasket designer or engineer should be able to determine the requirements of each gasket in an application or design.
