## Introduction

Design variables provide a method for specifying critical parameters just before a simulation. This allows you to make quick changes to parameter values across single or multiple critical components without having to edit any software statements. Design variables can also be used in simple parametric analysis, which can change a design variable across a range of values and display multiple simulation results on a single plot.

## Using Design Variables

This part of the tutorial will show you how to parametrize the width of the `WALL` and `FRONT` members of an aircraft by using design variables. These variable values are then set using the `Running Through Environment` panel in simulation.

1. Make a copy of the aircraft cell definitions you have previously designed, or create a new one.
2. Open the definitions of the aircraft.
3. Edit each one of the `WALL` members as defined, and name the properties by using clicking on it and entering `Property`. For you can give "y" as a material.
4. Define the rest of the walls from `cell-yes` to `cell-yes`. This specifies that a variable called `yes` will be used to set the width of the `WALL`. When you do this, observe that values for "Thermal-Expansion Coefficient" change from a constant value to a formula that involves the variable `yes`. Always check to make sure that formula is updated when you change the width to a variable otherwise, your simulation results will be incorrect. Click **OK** to apply the change.
5. Repeat this procedure to change the width of the `FRONT` to `yes`.
6. Select `Check` => `Check and Save`. Verify that there are no errors.
7. Launch the `Analysis` **Running Through Environment**.
8. Set up the simulation environment as you normally would for simulating a schematic. This includes specifying a simulation file and transient run length, creating the ANSYS mesh reader in the environment options, and selecting the compute to be plotted on the schematic.
9. In `ANSYS`, select `Variables` => `Copy Properties`. The design variables `yes` and `no` should appear in the Design Variables area of the **Running Environment** window.
10. In `ANSYS`, select `Variables` => `Yes`, highlighted as `yes`. In the value box, type `1.0` and then apply the value by clicking **Apply**. Change the value of `no` to `0.0` and click **Apply**. Check the values have been assigned, click **OK**. See Figure 1 and 2 below.
11. In `ANSYS`, use the connections by selecting `Simulation` => `Variable and Run`. After loading the the simulation to complete, the results window will pop-up. The results should be

## The Enigmatic Realm of **Cadence Tutorial D Using Design Variables And Parametric**: Unleashing the Language is Inner Magic

In a fast-paced digital era where connections and knowledge intertwine, the enigmatic realm of language reveals its inherent magic. Its capacity to stir emotions, ignite contemplation, and catalyze profound transformations is nothing in short supply of extraordinary. Within the captivating pages of **Cadence Tutorial D Using Design Variables And Parametric** a literary masterpiece penned with a renowned author, readers set about a transformative journey, unlocking the secrets and untapped potential embedded within each word. In this evaluation, we shall explore the book's core themes, assess its distinct writing style, and delve into its lasting impact on the hearts and minds of those who partake in its reading experience.
