## CORE DRILLING

Core drilling can be considered both a geological and geophysical technique and can be used to determine the true vertical orientation of a target. The information and accuracy of the results are the foundation of seismic. Core drilling also provides the location of structural trap potential. Core drills are used frequently to measure aquifer thickness where the existing data is sparse (needed to correct downward time to depth). The two locations are determined and corrected by geophysics and geomechanics to determine pore structure, permeability, and compressibility. Structural geology, drilling, reservoirs and all the other significant well testing methods employed throughout exploration serve well to identify every resource.

## SEISMIC

Seismic behaviour does not occur in a uniform, linear fashion. Any pressure in any volume, high and low, will be affected by temperature, porosity, and the density of the rock. Seismic waves travel through the subsurface and are affected by the velocity of the rock. Seismic waves are used to determine the location of structural traps and to determine the thickness of the reservoir.
