**CyberPhysical Systems** Kostas Siozios, Dimitrios Soudris, Elias Kosmatopoulos, 2022-09-01 As systems continue to evolve they rely less on human decision making and more on computational intelligence This trend in conjunction to the available technologies for providing advanced sensing measurement process control and communication lead towards the new field of Cyber Physical System CPS Cyber physical

systems are expected to play a major role in the design and development of future engineering platforms with new capabilities that far exceed today's levels of autonomy, functionality, and usability. Although these systems exhibit remarkable characteristics, their design and implementation is a challenging issue as numerous heterogeneous components and services have to be appropriately modeled and simulated together. The problem of designing efficient CPS becomes far more challenging in case the target system has to meet also real-time constraints.

**CyberPhysical Systems Decision Making Mechanisms and Applications** describes essential theory, recent research, and large-scale use cases that addresses urgent challenges in CPS architectures. In particular, it includes chapters on Decision making for large-scale CPS, Modeling of CPS with emphasis at the control mechanisms, Hardware/software implementation of the control mechanisms, Fault-tolerant and reliability issues for the control mechanisms, and Cyberphysical user cases that incorporate challenging decision making.

**A Neural Network Approach to Fluid Quantity Measurement in Dynamic Environments** Edin Terzic, Jenny Terzic, Romesh Nagarajah, Muhammad Alamgir, 2012-04-23

Sloshing causes liquid to fluctuate, making accurate level readings difficult to obtain in dynamic environments. The measurement system described uses a single-tube capacitive sensor to obtain an instantaneous level reading of the fluid surface, thereby accurately determining the fluid quantity in the presence of slosh. A neural network-based classification technique has been applied to predict the actual quantity of the fluid contained in a tank under sloshing conditions. In "A neural network approach to fluid quantity measurement in dynamic environments," effects of temperature variations and contamination on the capacitive sensor are discussed, and the authors propose that these effects can also be eliminated with the proposed neural network-based classification system. To examine the performance of the classification system, many field trials were carried out on a running vehicle at various tank volume levels that range from 5 L to 50 L. The effectiveness of signal enhancement on the neural network-based signal classification system is also investigated. Results obtained from the investigation are compared with traditionally used statistical averaging methods, and it is proven that the neural network-based measurement system can produce highly accurate fluid quantity measurements in a dynamic environment. Although in this case a capacitive sensor was used to demonstrate the measurement system, this methodology is valid for all types of electronic sensors. The approach demonstrated in "A neural network approach to fluid quantity measurement in dynamic environments" can be applied to a wide range of fluid quantity measurement applications in the automotive, naval, and aviation industries to produce accurate fluid level readings.

Students, lecturers, and experts will find the description of current research about accurate fluid level measurement in dynamic environments using neural network approach useful.
