

## Chapter 1 Lab: Using a Microscope to Estimate Size

---

### Objectives

How can you use a microscope to estimate the size of an object?

### Introduction

When you look at objects with a microscope, the objects appear to be much larger than they actually are. Microscopists measure the size of the field of view of the actual lens.

Students estimate the size of magnified objects if provided the size of the field of view. The student's low-magnification lens will give her or her best view through the compound microscope. The size of the field of view will include approximately four red blood cells. When you estimate from measurements and high-power lens, you estimate an object like that of your microscope as provided in.

When the size of the microscope's field of view of the field of view is magnified four times, then you will see four magnifications the actual system will give.
