

Enzyme NOTES

WHAT is an enzyme? HOW do they work?

THE BIG IDEA: An **ENZYME** is a **PROTEIN** that functions as a **catalyst** to **SPEED UP** a **CHEMICAL REACTION** in the body; it is **NOT** used up in the chemical reaction, rather it is recycled and used over and over again

All enzymes are **proteins**.

Enzymes are **biological catalysts**.

- Catalyst speed up reactions.
- These reactions would take place anyway... the enzymes just speed them up!

CHARACTERISTICS of Enzymes –

1. Enzymes do not make anything happen that couldn't happen on its own, just makes it **happen faster**.
2. Enzymes are **not used up** in reactions. They can be used over and over again!
3. Enzymes are only needed in **small amounts**.
4. Each enzyme is **highly selective** about its substrate.
5. Enzymes chemically recognize, bind and **modify substrates**.

HOW is an enzymes SHAPE related to its FUNCTION??

THE BIG IDEA: An enzyme's **STRUCTURE DETERMINES** its **FUNCTION!!!!**

1. Enzymes are **highly specific**: they catalyze only one chemical reaction, having a specific **substrate**. This specificity results from an enzyme's **specific 3-dimensional shape**.
2. The part of the enzyme that binds to the substrate is called the **active site**. The active site has a 3-dimensional shape that precisely **matches** the 3-dimensional shape of the molecule to be reacted, called the **substrate**.
3. When the substrate and enzyme bind temporarily, an **enzyme-substrate complex** is formed.
4. The activation **energy** needed for the reaction to occur is **reduced**.
5. After the reaction is complete, the substrate has formed a **new product or products** and the **enzyme** is released to be **reused**.
6. Enzyme specificity is often described using the "lock-and-key" model of enzyme action: The shape of the active site (the "lock") determines which substrate (which "key") will "fit" into the enzyme. If the substrate ("key") can't fit into the active site ("lock"), the enzyme cannot catalyze the chemical reaction
7. Remember these key ideas...
 - a. The **SUBSTRATE** is the **REACTANT** in the chemical reaction that is catalyzed by the enzyme, the substance that is **CHANGED**
 - b. The **ACTIVE SITE** is the region on the enzyme where the substrate attaches; the shape of the active site determines which substrates the enzyme can bind.
 - c. Imagine a **KEY (the SUBSTRATE)** fitting a **LOCK (the ACTIVE SITE)**.
 - d. The **PRODUCT** is what you end up with after the chemical reaction has occurred.

ENZYME ACTION – can occur two ways:

1. Lock and Key model – the substrate molecule has a specific 3-dimensional shape that allows it to fit into the specific 3-dimensional shape of an enzyme's active site. Both enzyme and substrate already exist in these specific 3-dimensional shapes.
2. Induced Fit model – An interaction between the enzyme and substrate induces or changes the shape of the molecules to produce a suitable fit.
