This paper shows some of the adverse effects that can occur when plausible values are not used or are used incorrectly during analysis of large-scale survey data. To ensure that the uncertainty associated with measures of skills in large-scale surveys is properly taken into account, researchers need to follow the procedures outlined in the article and in more detail in, for example, Little and Rubin (1987) and Schafer (1997). There is no need to rely on computational shortcuts by averaging plausible values before calculations: analytical shortcuts such as averaging plausible values produce biased estimates and should be discouraged. All analyses using survey assessment results need not only use the data as provided by the different assessment organizations but also adhere to the appropriate procedures described in this article and the included references, as well as in the guides provided for users of international survey assessment databases.

**Prototypes and Production Rules** Janice S. Aikins, 1980 This thesis presents a system called CENTAUR which demonstrates the effectiveness of representing prototypical knowledge in a combination of frames and production rules for performing computer consultations Key knowledge representation and control structure problems in production rule systems similar to MYCIN are identified and a set of important characteristics of the structures used for representing problem solving knowledge is given CENTAUR's frames or prototypes complement the production rules to satisfy these characteristics and represent expected patterns of data that permit a more focused hypothesis directed approach to problem solving Among the characteristics identified as desirable in the representation structures are the ability to explicitly represent a prototypical case b the context in which knowledge is applied and c the strategies for applying that knowledge CENTAUR's prototypes consist of patterns of knowledge in the domain which serve as broad contexts guiding the more detailed processing of the production rules Strategies for the consultation or control knowledge are represented in the prototypes separately from other kinds of domain knowledge This allows the domain expert to specify control knowledge that is specific to each prototype Examples are presented which demonstrate how this explicit representation facilitates explanations of the system's reasoning Further the organization of knowledge in CENTAUR provides a useful framework for acquiring new knowledge
