

Chapter 2

Chemical Passivation of Ge(111) Surfaces

2.1 Background

A stable, low-defect-density GeO_x/Ge interface that is analogous to the $\text{SiO}_x/\text{Si}(100)$ interface cannot be formed, so the elimination of surface oxide from Ge would be important to the utilization of Ge as a device material. The original surface passivation through Grignard alkylation of a diamond-type semiconductor had in fact been performed on Ge in 1962.¹ The researchers were successful in eliminating the influence of atmospheric moisture upon the electronic properties of the crystal surface, but still suffered from a large density of surface states, possibly because of an overly aggressive etching procedure. Very little follow-up work on such organic passivation methods was done in the ensuing decades. More recent work has shown that a variation on that early procedure is useful in passivating Si surfaces.^{2,3} The alkylated Ge(111) surfaces described in this research were prepared in a similar manner, with some modifications. This chapter is a description of the chemical methods utilized.

Proper cleaning of the substrate is crucial to any successful surface modification.
