vehicles such as dicycles tricycles and quadracycles As with unicycles bikes lack lateral stability when stationary and under most circumstances can only remain upright when moving forward Experimentation and mathematical analysis have shown that a bike stays upright when it is steered to keep its center of mass over its wheels This steering is usually supplied by a rider or in certain circumstances by the bike itself Several factors including geometry mass distribution and gyroscopic effect all contribute in varying degrees to this self stability but long standing hypotheses and claims that any single effect such as gyroscopic or trail is solely
