Digest of Technical Papers ,1988 *Air Force Civil Engineer* ,1968 **Analog Circuit Design for Process Variation-Resilient Systems-on-a-Chip** Marvin Onabajo,Jose Silva-Martinez,2012-03-08 This book describes several techniques to address variation related design challenges for analog blocks in mixed signal systems on chip The methods presented are results from recent research works involving receiver front end circuits baseband filter linearization and data conversion These circuit level techniques are described with their relationships to emerging system level calibration approaches to tune the performances of analog circuits with digital assistance or control Coverage also includes a strategy to utilize on chip temperature sensors to measure the signal power and linearity characteristics of analog RF circuits as demonstrated by test chip measurements Describes a variety of variation tolerant analog circuit design examples including from RF front ends high performance ADCs and baseband filters Includes built in testing techniques linked to current industrial trends Balances digitally assisted performance tuning with analog performance tuning and mismatch reduction approaches Describes theoretical concepts as well as experimental results for test chips designed with variation aware techniques **A Volume of Technical Papers Presented - November 16-18, 1964** American Institute of Aeronautics and Astronautics Space Simulation Testing. Conference,1964 **Preprints of Technical Papers** ,1971 **Proceedings of Technical Papers** ,2005 **Enabling Technologies for Very Large-Scale Synaptic Electronics** Themis Prodromakis,Alexantrou Serb,2018-07-05 An important part of the colossal effort associated with the understanding of the brain involves using electronics hardware technology in order to reproduce biological behavior in silico The idea revolves around leveraging decades of experience in the electronics industry as well as new biological findings that are employed towards reproducing key behaviors of fundamental elements of the brain notably neurons and synapses at far greater speed scale products than any software only implementation can achieve for the given level of modelling detail So far the field of neuromorphic engineering has proven itself as a major source of innovation towards the silicon brain goal with the methods employed by its community largely focused on circuit design analogue digital and mixed signal and standard commercial Complementary Metal Oxide Silicon CMOS technology as the preferred tools of choice when trying to simulate or emulate biological behavior However alongside the circuit oriented sector of the community there exists another community developing new electronic technologies with the express aim of creating advanced devices beyond the capabilities of CMOS that can intrinsically simulate neuron or synapse like behavior A notable example concerns nanoelectronic devices responding to well defined input signals by suitably changing their internal state weight thereby exhibiting synapse like plasticity This is in stark contrast to circuit oriented approaches where the synaptic weight variable has to be first stored typically as charge on a capacitor or digitally and then appropriately changed via complicated circuitry The shift of very much complexity from circuitry to devices could potentially be a major enabling factor for very large scale synaptic

electronics particularly if the new devices can be operated at much lower power budgets than their corresponding traditional circuit replacements To bring this promise to fruition synergy between the well established practices of the circuit oriented approach and the vastness of possibilities opened by the advent of novel nanoelectronic devices with rich internal dynamics is absolutely essential and will create the opportunity for radical innovation in both fields The result of such synergy can be of potentially staggering impact to the progress of our efforts to both simulate the brain and ultimately understand it In this Research Topic we wish to provide an overview of what constitutes state of the art in terms of enabling technologies for very large scale synaptic electronics with particular stress on innovative nanoelectronic devices and circuit system design techniques that can facilitate the development of very large scale brain inspired electronic systems
