Training Manual United States. Army. Signal Corps,1925 *Designing Audio Circuits* Robert Sontheimer,1998 How does speech music or indeed any sound get from the record the CD or the cassette tape to the loudspeaker This is a question that many people keep on asking and to which this book endeavours to give a comprehensible answer Understanding the background of the process is a first requirement which is why the author in the description of single components makes clear what exactly happens in the component An understanding is also engendered of phenomena such as noise hum distortion and others as well as standards such as the decibel and the RIAA characteristic Designing circuits is practically impossible without an understanding of the various networks involved in the conversion of the input sound to the sound emanating from a loudspeaker To this end the author describes four important basic circuits using an operational amplifier a component without which modern audio circuits can no longer be imagined Variants of these four circuits return in many of the other circuits contained in this book Building circuits including ancillary and special ones form the practical parts of this book

These circuits can be applied in audio equipment as well as with certain musical instruments There are preamplifiers filters output stages power supplies compandors mixer panels level meters bandwidth limiters headphone amplifiers playback stages as well as tips on construction and faultfinding **1926-1929** National Board of Fire Underwriters,1926 Army Extension Courses United States.
