

An Overview of Landing Gear Design and Development

The landing gear design and integration process encompasses knowledge of many engineering disciplines such as structures, dynamics, kinematics, fluid mechanics and runway flotation. The geometry, flotation requirements, mission requirements and operational requirements of the aircraft govern the landing gear configuration.

The configuration design includes choice of number of wheels, tire sizes, pressures, type of shock absorbers, landing-gear layout, retraction kinematics and bay geometry design.

Airworthiness regulations play a crucial role in arriving at the landing gear configuration, such as sink rate, allowable load factors and ground maneuvering conditions, stipulated in the applicable airworthiness regulations.

Some of these Airworthiness Regulations are given in Table 1.

Aircraft Type	Regulations/ Specifications
Utility and Aerobatic Airplanes	FAR 23, CS 23, CAR 23
Civil Transport Airplanes	FAR 25, CS 25, CAR 25
Military Aircraft	US MIL Specifications, DEF-STAN-970

Table 1: Airworthiness Regulations

A brief summary of various life cycle stages of landing gear design and development are described below:

Concept Design

The concept design starts with a study of all design specifications and airworthiness regulations. A concept is then evolved while meeting the functional and regulatory requirements. Major design drivers are performance, safety, cost, time frame, technology and resources. The landing gear location is arrived at and type of landing gear is selected. The landing gear geometry is defined along with kinematics. Steering concepts are also identified in this phase. The ground loads are estimated using dynamic simulations for material selection and preliminary sizing of components. The actuation mechanisms and loads are also worked out in this phase. Various trade-off studies are performed to optimize weight, volume and cost. Based on these trade-off studies a best concept is selected.

Preliminary Design

In the preliminary design phase, dynamic simulations are carried out for landing, take-off and retraction kinematics to arrive at data required for sizing of components and material selection. Preliminary design of components is performed and weight estimates are arrived at.
