Computable? Simon Deakin,Christopher Markou,2020-11-26 What does computable law mean for the autonomy authority and legitimacy of the legal system Are we witnessing a shift from Rule of Law to a new Rule of Technology Should we even build these things in the first place This unique volume collects original papers by a group of leading international scholars to address some of the fascinating questions raised by the encroachment of Artificial Intelligence AI into more aspects of legal process administration and culture Weighing near term benefits against the longer term and potentially path dependent implications of replacing human legal authority with computational systems this volume pushes back against the more

uncritical accounts of AI in law and the eagerness of scholars governments and LegalTech developers to overlook the more fundamental and perhaps bigger picture ramifications of computable law With contributions by Simon Deakin Christopher Markou Mireille Hildebrandt Roger Brownsword Sylvie Delacroix Lyria Bennet Moses Ryan Abbott Jennifer Cobbe Lily Hands John Morison Alex Sarch and Dilan Thampapillai as well as a foreword from Frank Pasquale *Critical Digital Humanities* James E Dobson,2019-03-16 Can established humanities methods coexist with computational thinking It is one of the major questions in humanities research today as scholars increasingly adopt sophisticated data science for their work James E Dobson explores the opportunities and complications faced by humanists in this new era Though the study and interpretation of texts alongside sophisticated computational tools can serve scholarship these methods cannot replace existing frameworks As Dobson shows ideas of scientific validity cannot easily nor should be adapted for humanities research because digital humanities unlike science lack a leading edge horizon charting the frontiers of inquiry Instead the methods of digital humanities require a constant rereading At the same time suspicious and critical readings of digital methodologies make it unwise for scholars to defer to computational methods Humanists must examine the tools including the assumptions that went into the codes and algorithms and questions surrounding their own use of digital technology in research Insightful and forward thinking *Critical Digital Humanities* lays out a new path of humanistic inquiry that merges critical theory and computational science

Algorithms Unlocked Zoe Codewell, AI, 2025-01-13 *Algorithms Unlocked* offers a comprehensive journey through the fundamental principles of computational problem solving focusing on how computers efficiently tackle complex challenges The book masterfully breaks down three critical areas sorting algorithms for data organization searching techniques for information retrieval and optimization methods for finding optimal solutions What sets this book apart is its emphasis on understanding the why behind algorithms rather than just their implementation making it accessible to both beginners and experienced practitioners The book s progression is thoughtfully structured beginning with essential mathematical and computational foundations before advancing to more complex concepts Readers explore classical sorting algorithms like quicksort and merge sort delve into searching techniques such as binary and depth first search and discover optimization approaches through greedy algorithms and dynamic programming Each topic is presented with a balance of theoretical understanding and practical application supported by real world examples and performance analyses While the content maintains technical rigor it remains remarkably accessible through its tutorial style format and focus on algorithmic thinking rather than specific programming languages The book serves as both an educational resource and practical reference making it particularly valuable for computer science students software developers and professionals seeking to optimize their code Throughout its chapters readers gain insights into crucial concepts like algorithmic complexity efficiency trade offs and practical implementation considerations all while building a solid foundation in computational problem solving methods

Operating Systems Raymond W. Turner, 1986 *Real Time Programming 1998 (WRTP '98)* Lichen Zhang, A. H. Frigeri, Liangchi Zhang, Wolfgang A. Halang, 1998 With its tradition of more than three decades, the IFAC/IFIP Workshop on Real Time Programming (WRTP) has become an excellent forum for exchanging information on recent technological advances and practices in real-time computing, a field that is becoming an essential enabling discipline of both control engineering and computer science and engineering. As there is an accelerated growth of demands for the functionality and dependability of real-time systems, our intellectual and engineering abilities are being challenged to come up with practical solutions to the problems faced in the design and development of complex real-time systems. The Workshop on Real Time Programming provides an opportunity to assess the state of the art, to present new results, and to discuss possible lines of future developments. Primarily, it focuses on software development for real-time systems and real-time operating systems. This 1998 Workshop covered the latest research and developments in real-time communication and formal specification, operating systems, and performance analysis, scheduling, use of neural networks in real-time systems, embedded systems, and programming methodologies. Contributions came from Europe, North America, Australia, and the Far East. In

addition to these high quality technical papers the programme also featured three world renowned keynote speakers

Introduction to Multichip Modules Naveed A. Sherwani, Qiong Yu, Sandeep Badida, 1995-11-23 Advantages of MCMs over traditional packaging methods for electronic based applications in computers aviation and the military Introduction to Multichip Modules discusses both custom built MCMs and programmable MCMs and their role in reducing cost and improving turnaround time An invaluable resource for students and professionals in electrical engineering who design MCMs and MCM based systems and for those in computer science who develop CAD tools for MCMs this **Restructuring Symbolic Programs for Concurrent Execution on Multiprocessors** James R. Larus, 1989 CURARE the program restructurer described in this dissertation automatically transforms a sequential Lisp program into an equivalent concurrent program that executes on a multiprocessor CURARE first analyzes a program to find its control and data dependences This analysis is most difficult for references to structures connected by pointers CURARE uses a new data dependence algorithm which finds and classifies these dependencies The analysis is conservative and may detect conflicts that do not arise in practice A programmer can temper and refine its results with declarations Dependences constrain the program's concurrent execution because in general two conflicting statements cannot execute in a different order without affecting the program's result A restructurer must know all dependences in order to preserve them However not all dependences are essential to produce the program's result CURARE attempts to transform the program so it computes its result with fewer conflicts An optimized program will execute with less synchronization and more concurrency CURARE then examines loops in a program to find those that are unconstrained or lightly constrained by dependences By necessity CURARE treats recursive functions as loops and does not limit itself to explicit program loops Recursive functions offer several advantages over explicit loops since they provide a convenient framework for inserting locks and handling the dynamic behaviour of symbolic programs Loops that are suitable for concurrent execution are changed to execute on a set of concurrent server processes These servers execute single loop iterations and therefore need to be extremely inexpensive to invoke Restructured programs execute significantly faster than the original sequential programs This improvement is large enough to attract programmers

to a multiprocessor particularly since it requires little effort on their part Although restructured programs may not make optimal use of a multiprocessor's parallelism they make good use of a programmer's time **Proceedings**,2000
