Morris, 2006 Comprehensive multidisciplinary text for low back conditions Because today's patients expect their clinicians to possess an in depth understanding of available treatments this text covers the broad spectrum of clinical options currently available From chiropractic to osteopathy from medicine to physical therapy from occupational medicine to evidence based health care from psychology to surgery from pain medicine to manipulation from post surgical rehabilitation to end stage training of elite athletes this textbook brings all the specialists together to allow clinicians direct access to state of the art standards of practice from a single source **The Mechanisms Underlying Differential Biomechanical and Clinical Responses in Patients with Low Back Pain Following Spinal Manipulative Therapy** Yu Lok Wong, 2015 Background Spinal manipulative therapy SMT is a common intervention for nonspecific low back pain LBP Various studies have shown independently that LBP patients who respond favorably to SMT differ from those non responders in terms of baseline or post SMT changes in physical characteristics These physical characteristics include spinal stiffness lumbar multifidus function and or disc diffusion Unfortunately prior to this dissertation no research has used a unified methodology to investigate various physical characteristics in a single cohort of LBP individuals or to compare these physical characteristics with the data from untreated LBP or asymptomatic controls Objective To quantify whether physical characteristics of SMT responders and non responders as defined by three different dichotomization strategies differ from those of untreated LBP and asymptomatic controls Methods Two systematic reviews and three clinical studies a reliability experiment a pain induction study and a non randomized clinical trial were conducted

In the clinical studies the LBP participants who received SMT were dichotomized into responders and non responders based on 1 a clinical prediction rule 2 self reported pain scores or 3 self reported disability on Day 7 Results The two systematic reviews found conflicting evidence regarding the relation between baseline or temporal changes in morphometry function of lumbar multifidus and LBP outcomes following various conservative treatments The reviews also revealed conflicting evidence regarding the baseline function of transversus abdominis in predicting LBP outcomes There was strong evidence against a temporal relation between changes in the morphometry function of transversus abdominis during conservative treatments and changes in LBP symptoms Transversus abdominis was included in the reviews because multifidus was proposed to work closely with transversus abdominis to maintain spinal stability which might be related to LBP Excellent intra rater intra observer reliability was found for all the measurements adopted in clinical studies These measurements included spinal degeneration grading and intervertebral disc diffusion measurements on lumbar magnetic resonance images spinal stiffness measurements and lumbar multifidus thickness assessments Of the clinical studies the pain induction study revealed that experimental pain caused temporary increases in spinal stiffness and concurrent trunk muscle activity during the stiffness test but temporary decreases in lumbar multifidus thickness ratios a proxy of multifidus function during volitional contraction Of the clinical studies the imaging trial highlighted that SMT non responders as defined by self reported pain or disability scores on Day 7 tended to have higher prevalence of severe facet joint degeneration and poorer caudal lumbar disc diffusion at baseline as compared to the responders and untreated LBP controls Conversely the responders defined by self reported pain or disability demonstrated positive post SMT changes in water diffusion across all the lumbar discs as compared to the non responders or untreated LBP controls In the clinical studies all the SMT responders regardless of dichotomization strategies consistently displayed immediate and or sustained decreases in spinal stiffness and increases in lumbar multifidus function during volitional contraction No such change was observed in the non responders or asymptomatic controls Conclusion Consistent physical changes within SMT responders imply that SMT imparts a multidimensional effect which includes alterations in biomechanics stiffness disc diffusion neurophysiology muscle function and pain but only in subjects who are receptive to SMT less degenerative change As such this work provides a foundation to investigate the origin of the heterogeneous nature of LBP the diversity of therapeutic mechanisms and how aligning these characteristics may optimize clinical and societal outcomes
