## An Introduction to Architecture and programming 8051 and 80196

### INTRODUCTION

While studying microprocessor based system design, one may note that a stand alone microprocessor is not self-sufficient. It requires other components like memory and input/output devices to form a minimum workable system configuration. Rather, one may infer that in addition to a microprocessor, the memory and I/O ports are integral parts of a practical system. To have all these components in a discrete form and to assemble them on a PCB, is usually not an affordable solution for the following reasons:

1. The overall system cost of a microprocessor based system built around a CPU, memory and other peripherals is high as compared to a microcontroller based system.
2. A large sized PCB is required for assembling all these components, resulting in an enhanced cost of the system.
3. Design of such PCBs require a lot of effort and time and thus the overall product design requires more time.
4. Due to the large size of the PCB and the discrete components used, physical size of the product is big and hence it is not handy.
5. As discrete components are used, the system is not reliable nor is it easy to trouble- shoot such a system.

Considering all these problems, Intel decided to integrate a microprocessor along with I/O ports and minimum memory into a single package. Another frequently used peripheral, a programmable timer, was also integrated to make this device a self-sufficient one. This device which contains a microprocessor and the above mentioned components has been named a *microcontroller*. A microcontroller a microprocessor with integrated peripherals. The introduction of microcontrollers drastically changed the microprocessor based system design concepts, specially in case of small dedicated systems. Design with microcontrollers has the following advantages:

1. As the peripherals are integrated into a single chip, the overall system cost is very low.
2. The size of the product is small as compared to the microprocessor based systems thus very handy.
3. The system design requires very little efforts and is easy to troubleshoot and maintain.

The title uses a word advanced because this has been implemented in some of the countries but it has some limitations and negative aspects in the existing system Here we give solutions for those issues and made this useful for investigation purpose which was not there in the earlier system Machine Learning for Audio, Image and Video Analysis Francesco

Camastra,Alessandro Vinciarelli,2015-07-21 This second edition focuses on audio image and video data the three main types of input that machines deal with when interacting with the real world A set of appendices provides the reader with self contained introductions to the mathematical background necessary to read the book Divided into three main parts From Perception to Computation introduces methodologies aimed at representing the data in forms suitable for computer processing especially when it comes to audio and images Whilst the second part Machine Learning includes an extensive overview of statistical techniques aimed at addressing three main problems namely classification automatically assigning a data sample to one of the classes belonging to a predefined set clustering automatically grouping data samples according to the similarity of their properties and sequence analysis automatically mapping a sequence of observations into a sequence of human understandable symbols The third part Applications shows how the abstract problems defined in the second part underlie technologies capable to perform complex tasks such as the recognition of hand gestures or the transcription of handwritten data Machine Learning for Audio Image and Video Analysis is suitable for students to acquire a solid background in machine learning as well as for practitioners to deepen their knowledge of the state of the art All application chapters are based on publicly available data and free software packages thus allowing readers to replicate the experiments
