Physics A Course of Lectures covers the most general problems of protein structure folding and function. It describes key experimental facts and introduces concepts and theories dealing with fibrous membrane and water soluble globular proteins in both their native and denatured states. The book systematically summarizes and presents the results of several decades of worldwide fundamental research on protein physics structure and folding describing many physical models that help readers make estimates and predictions of physical processes that occur in proteins. New to this revised edition is the inclusion of novel information on amyloid aggregation natively disordered proteins protein folding in vivo protein motors misfolding chameleon proteins advances in protein engineering design and advances in the modeling of protein folding. Further the book provides problems with solutions many new and updated references and physical and mathematical appendices. In addition new figures including stereo drawings with a special appendix showing how to use them are added making this an ideal resource for graduate and advanced undergraduate students and researchers in academia in the fields of biophysics physics biochemistry biologists biotechnology and chemistry. Fully revised and expanded new edition based on the latest research developments in protein physics. Written by the world's top expert in the field. Deals with fibrous membrane and water soluble globular proteins in both their native and denatured states. Summarizes in a systematic form the results of several decades of worldwide fundamental research on protein physics and their structure and folding. Examines experimental data on protein structure in the post genome era.

Legume Breeding in Transition: Innovation and Outlook Rafiul Amin Laskar, Amir Raina, Samiullah Khan, Nasya Borisova Tomlekova, Waltram Ravelombola, Mahendar Thudi, 2023-09-06 Legumes family Fabaceae comprise a diverse range of crops grown worldwide which are important constituents of sustainable agriculture and harbour a role in improving human and livestock health. Legumes serve as a rich source of plant based proteins rank second in nutrition value after cereals and are ideal to supplement a protein deficient cereal based human diet. Legumes also provide other essential services to agriculture through their ability to fix atmospheric nitrogen, recycle nutrients, enhance soil carbon content and diversify cropping systems. Legume production and seed quality are affected by a range of biotic pests, insect diseases and weeds and abiotic stresses, drought, heat, frost and salinity. In addition to this rapidly changing climate, shrinking arable land, erratic rainfalls and depleting water and other natural resources impact legume production and threaten food and nutrition security worldwide. Persistent demand for legume crops is existing to fulfil the food requirements of an ever growing human population. Therefore legume breeders and geneticists have employed different conventional and modern breeding strategies to improve yield, resistance to biotic and abiotic stresses, grain quality and nutritional and nutraceutical properties. Conventional breeding strategies are laborious, time consuming, expensive and inefficient to achieve the desired goals. However, advanced breeding techniques such as alien gene introgression, genomics assisted breeding, transgenic technology, speed breeding, association and mapping studies, genome editing and omics will contribute to sustainable agriculture and food security.
