Legal Protection for Computer-Implemented Inventions Sabine Kruspig,Claudia Schwarz,2016-04-24 As a result of the incorporation of computer software into countless commercial and industrial products the patentability of software has become a vital issue in intellectual property law This indispensable book provides an overview on the current status of computer implemented inventions in patent law across Europe and major jurisdictions worldwide A hugely practical field research tool with guidance based on case law it examines the major hurdles in each particular country and describes the best practice to be adopted Clearly showing how enforceable software patent applications can be competitively drafted and how a patent portfolio for computer implemented inventions can be established

in several countries without spending money unnecessarily on problematic examination proceedings this book covers such issues and topics as the following claim categories for patent applications sufficient level of abstraction breadth of the claimed invention fundamental terms of computing and terminological traps probability for patents dependent on software application areas and patents in core areas of computing With separate chapters for the key countries Germany the United Kingdom France the United States China Korea Japan India and the European Patent Office the legal situation for computer implemented inventions in each country or region this book includes guidance on prosecution under national law analyses of relevant court decisions practice checklists and an outlook on future developments The authors describe claim formulation based on actual cases and on principles of computer science in order to show what might be or might not be patentable in each jurisdiction With this incomparable resource patent attorneys and patent professionals in companies will get a basis for making decisions about the most appropriate jurisdictions in which to file patent applications This book will also be of great value to computer professionals who are affected by the protection of software or who are actively involved in the protection of software by patent law

Linear and Nonlinear Programming David G. Luenberger,Yinyu Ye,2015-06-25 This new edition covers the central concepts of practical optimization techniques with an emphasis on methods that are both state of the art and popular One major insight is the connection between the purely analytical character of an optimization problem and the behavior of algorithms used to solve a problem This was a major theme of the first edition of this book and the fourth edition expands and further illustrates this relationship As in the earlier editions the material in this fourth edition is organized into three separate parts Part I is a self contained introduction to linear programming The presentation in this part is fairly conventional covering the main elements of the underlying theory of linear programming many of the most effective numerical algorithms and many of its important special applications Part II which is independent of Part I covers the theory of unconstrained optimization including both derivations of the appropriate optimality conditions and an introduction to basic algorithms This part of the book explores the general properties of algorithms and defines various notions of convergence Part III extends the concepts developed in the second part to constrained optimization problems Except for a few isolated sections this part is also independent of Part I It is possible to go directly into Parts II and III omitting Part I and in fact the book has been used in this way in many universities New to this edition is a chapter devoted to Conic Linear Programming a powerful generalization of Linear Programming Indeed many conic structures are possible and useful in a variety of

applications It must be recognized however that conic linear programming is an advanced topic requiring special study Another important topic is an accelerated steepest descent method that exhibits superior convergence properties and for this reason has become quite popular The proof of the convergence property for both standard and accelerated steepest descent methods are presented in Chapter 8 As in previous editions end of chapter exercises appear for all chapters From the reviews of the Third Edition this very well written book is a classic textbook in Optimization It should be present in the bookcase of each student researcher and specialist from the host of disciplines from which practical optimization applications are drawn Jean Jacques Strodiot Zentralblatt MATH Vol 1207 2011
