Nonlinearity in Living Systems: Theoretical and Practical Perspectives on Metrics of Physiological Signal Complexity Sladjana Spasić,Srdjan Kesić,2019-06-28 The biological basis of physiological signals is incredibly complex While many types of research certainly appreciate molecular cellular and systems approach to

unravel overall biological complexity in the recent decades the interest for mathematical and computational characterization of structural and functional basis underlying biological phenomena gain wide popularity among scientists Nowadays we witnessed wide range applications of nonlinear quantitative analysis that produced measures such as fractal dimension power law scaling Hurst exponent Lyapunov exponent approximate entropy sample entropy Lempel Ziv complexity as well as other metrics for predictions of onset and progression of many pathological conditions especially in the central nervous systems CNS In this Research Topic we seek to bring together the recent practical and theoretical advances in the development and application of nonlinear methods or narrower fractal based methods for characterizing the complex physiological systems at multiple levels of the organization We will discuss the use of various complexity measures and appropriate parameters for characterizing the variety of physiological signals up to the systems level There are multiple aims in this topic The recent advancement in the application of nonlinear methods for both normal and pathological physiological conditions is the first The second aim is to emphasize the more recent successful attempt to apply these methods across animal species Finally a comprehensive understanding of advantages and disadvantages of each method especially between its mathematical assumptions and real world applicability can help to find out what is at stake regarding the above aims and to direct us toward the more fruitful application of nonlinear measures and statistics in physiology and biology in general

Advancements in Running Biomechanics: Bridging Research and Practical Applications Weijie Fu,Zixiang Gao,Yang Yang ,Tony Lin-Wei Chen,2026-03-31 The study of running biomechanics has emerged as a dynamic and interdisciplinary field combining advanced research with practical applications to enhance athletic performance and reduce injury risks This area has gained considerable attention due to the increasing interest in optimizing training regimens and improving the overall health and efficiency of athletes and fitness enthusiasts Recent studies have introduced innovative technologies and methodologies that have revolutionized how athletes train focusing on biomechanical insights to refine running techniques develop superior footwear and apparel and utilize advanced wearable technology Despite these advancements there remain significant gaps in understanding the complex interactions between various biomechanical factors and their practical applications Ongoing debates and research continue to explore the intricate dynamics of neuromuscular control the effects of fatigue on running mechanics and effective strategies for injury prevention and rehabilitation There is a pressing need for further investigation to bridge the gap between theoretical research and its practical implementation in the field of running biomechanics This Research Topic aims to encapsulate the latest advancements in running biomechanics and explore the intersection of research and practical application We seek to deepen our understanding of the biomechanics of running by addressing key questions such as how running form can be optimized the role of footwear and apparel in enhancing performance and the impact of neuromuscular control and fatigue on running mechanics Additionally we aim to test hypotheses related to injury prevention and rehabilitation strategies as well as the application of wearable technology in

monitoring and improving running performance To gather further insights in the field of running biomechanics we welcome articles addressing but not limited to the following themes Biomechanical Analysis in Running Investigating adaptations and alterations in running mechanics for performance enhancement and injury prevention Research and Application of Athletic Equipment Examining the influence of shoe and apparel designs materials and technologies on running biomechanics Neuromuscular Control Exploring the interplay of neuromuscular control during running and the effects of various conditions and training interventions Fatigue and Injury Risk Analyzing the relationship between fatigue changes in running mechanics and injury risks Injury Prevention and Rehabilitation Evaluating the effectiveness of rehabilitation methods including equipment intervention and gait retraining for running injuries Application of Wearable Devices Investigating the potential of wearable sensors and algorithms in monitoring and enhancing running performance and biomechanics
