Monitoring of Machinery Using Motor Current Signature Analysis , 1989 Motor current signature analysis MCSA is a
powerful monitoring tool for motor driven equipment that provides a nonintrusive means for detecting the presence of
mechanical and electrical abnormalities in the motor and the driven equipment including altered conditions in the process
downstream of the motor driven equipment It was developed at the Oak Ridge National Laboratory as a means for
determining the effects of aging and service wear systems but it is applicable to a broad range of machinery MCSA is based
on the recognition that an electric motor ac or dc driving a mechanical load acts as an efficient and permanently available
transducer by sensing mechanical load variations large and small long term and rapid and converting them into variations in
the induced current generated in the motor windings These motor current variations are carried by the electrical cables
processes as desired Motor current signatures obtained in both time and over time to provide early indication of degradation
Successful applications of MCSA technology patent applied for include not only motor operated valves but also pumps of
various designs blowers and air conditioning systems Examples are presented briefly and speculation regarding the
applicability of MCSA to a broader range of equipment monitoring and production line testing is also given 1 ref 13 figs
