Understanding Molecular Simulation Daan Frenkel, Berend Smit, 2001-10-19 Understanding Molecular Simulation From Algorithms to Applications explains the physics behind the recipes of molecular simulation for materials science Computer simulators are continuously confronted with questions concerning the choice of a particular technique for a given application A wide variety of tools exist so the choice of technique requires a good understanding of the basic principles More importantly such understanding may greatly improve the efficiency of a simulation program The implementation of simulation methods is illustrated in pseudocodes and their practical use in the case studies used in the text Since the first edition only five years ago the simulation world has changed significantly current techniques have matured and new ones have appeared This new edition deals with these new developments in particular there are sections on Transition path sampling and diffusive barrier crossing to simulating rare events Dissipative particle dynamic as a coarse grained simulation technique Novel schemes to compute the long ranged forces Hamiltonian and non Hamiltonian dynamics in the context constant temperature and constant pressure molecular dynamics simulations Multiple time step algorithms as an alternative for constraints Defects in solids The pruned enriched Rosenbluth sampling recoil growth and concerted rotations for complex molecules Parallel tempering for glassy Hamiltonians Examples are included that highlight current applications and the codes of case studies are available on the World Wide Web Several new examples have been added since the first edition to illustrate recent applications Questions are included in this new edition No prior knowledge of computer simulation is assumed

Studies Relating to the Numerical Simulation of Molecular Dynamics Peter Gee, 2005 **Molecular Dynamics On Parallel Computers** Peter Grassberger, Rudiger Esser, Johannes Grotendorst, Marius Lewerenz, 2000-02-22 Molecular dynamics is a well established technique for simulating complex many particle systems in many areas of physics chemistry and astrophysics The huge computational requirements for simulations of large systems especially with long range forces demand the use of massively parallel computers Designing efficient algorithms for these problems is a highly non trivial task This book contains the invited talks and abstracts presented at a conference by more than 100 researchers from various fields computer science solid state physics high energy physics polymers biochemistry granular materials and astrophysics Most of the contributions have been written by users of massively parallel computers and deal with practical issues but there are also contributions tackling more fundamental algorithmic problems **Computational Molecular Dynamics: Challenges, Methods, Ideas** Peter Deuffhard, 1999 On May 21 24 1997 the Second International Symposium on Algorithms for Macromolecular Modelling was held at the Konrad Zuse Zentrum in Berlin The event brought together computational scientists in fields like biochemistry biophysics physical chemistry or statistical physics and numerical analysts as well as computer scientists working on the advancement of algorithms for a total of over 120 participants from 19

countries In the course of the symposium the speakers agreed to produce a representative volume that combines survey articles and original papers all refereed to give an impression of the present state of the art of Molecular Dynamics The 29 articles of the book reflect the main topics of the Berlin meeting which were i Conformational Dynamics ii Thermodynamic Modelling iii Advanced Time Stepping Algorithms iv Quantum Classical Simulations and Fast Force Field and v Fast Force Field Evaluation
