## Application / Function

Pressure gaskets are generally used to seal and support the flange, the combination of both ends is a flange to allow installation. These consist of 2 gaskets which distribute load (flange is a pressure vessel application as all flanges are high temperature used to increase the quality). A gasket is used to maintain the pressure in a system and to stop it from leaking throughout the life cycle application. The gasket compresses to form a seal between the mating surfaces of the vessel. This is done by creating a uniform force on the gasket to ensure the seal is maintained over the application between the mating surfaces. If the gasket creates uniformity for uniform and consistent through the life of the application then would be covered for a gasket.

In order to determine the application requirements will require the gasket designer to determine the gasket to select a certain seal. Every gasket application or design has many requirements therefore that must be addressed by ensuring the performance of what the gasket is required to do in the application.
