

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal surfaces to the exterior, the interior or both ends of a cylinder to allow lubrication. These consist of 2 gaskets which distribute seal fluid in a groove with an application on all three are made specifically used to increase life span. A gasket is used to maintain the pressure in a cylinder and to prevent leakage throughout the life span application. The gasket compresses to the shape of the cylinder to form a seal. The seal is formed by the gasket material being compressed between the mating surfaces of the cylinder. This is done by the gasket material being compressed between the mating surfaces of the cylinder. If the gasket material is not compressed between the mating surfaces of the cylinder, the gasket will not seal the cylinder.

In order to determine the application requirements will require the gasket designer to determine the gasket to be used in a certain use. Every gasket application or design has its own requirements therefore they must be addressed by specifying the performance of what the gasket is required to do in the application.
