## **Digital Image Processing 2nd Ed Computer Science:**

**Introduction to Image Processing and Analysis** John C. Russ, J. Christian Russ, 2017-12-19 Image processing comprises a broad variety of methods that operate on images to produce another image. A unique textbook, *Introduction to Image Processing and Analysis*, establishes the programming involved in image processing and analysis by utilizing skills in C compiler and both Windows and MacOS programming environments. The provided mathematical background illustrates the workings of algorithms and emphasizes the practical reasons for using certain methods, their effects on images, and their appropriate applications. The text concentrates on image processing and measurement and details the implementation of many of the most widely used and most important image processing and analysis algorithms. Homework problems are included in every chapter with solutions available for download from the CRC Press website. The chapters work together to combine image processing with image analysis. The book begins with an explanation of familiar pixel array and goes on to describe the use of frequency space. Chapters 1 and 2 deal with the algorithms used in processing steps that are usually accomplished by a combination of measurement and processing operations as described in chapters 3 and 4. The authors present each concept using a mixture of three mutually supportive tools: a description of the procedure with example images, the relevant mathematical equations behind each concept, and the simple source code in C which illustrates basic operations. In particular, the source code provides a starting point to develop further modifications. Written by John Russ, author of esteemed *Image Processing Handbook* now in its fifth edition, this book demonstrates functions to improve an image's features and detail visibility, improve images for printing or transmission, and facilitate subsequent analysis. *Object Detection and Recognition in Digital Images* Boguslaw Cyganek, 2013-05-20 Object detection, tracking, and recognition in images are key problems in computer vision. This book provides the reader with a balanced treatment between the theory and practice of selected methods in these areas to make the book accessible to a range of researchers, engineers, developers, and postgraduate students working in computer vision and related fields. Key features: Explains the main theoretical ideas behind each method which are augmented with a rigorous mathematical derivation of the formulas, their implementation in C, and demonstrated working in real applications. Places an emphasis on tensor and statistical based approaches within object detection and recognition. Provides an overview of image clustering and classification methods which includes subspace and kernel based processing, mean shift, and Kalman filter, neural networks, and k-means methods. Contains numerous case study examples of mainly automotive applications. Includes a companion website hosting full C implementation of topics presented in the book as a software library and an accompanying manual to the software platform. [Digital Image Processing](#) Rafael C. Gonzalez, Richard Eugene Woods, 2008 A comprehensive digital image processing book that reflects new trends in this field such as document image compression and data compression standards. The book includes a complete rewrite of image data compression, a new chapter on image analysis, and a new section on image morphology. [Encyclopedia of](#)
