Numerical and experimental investigations of distribution of gaseous emissions with the air flow in the indoor environment Umer Afzal,2017
There are many sources of emissions produced by burning fuel for power or heat through chemical reactions and from leaks from industrial processes or equipment There is always a possibility of a potential hazard when these gases enter into the indoor environment with the air flow The determination of the concentration profiles are necessary to evaluate the potential hazard posed by the gas spread The main objectives of this work are to develop an appropriate measurement methodology and a 3D CFD transient multicomponent simulation model for the determination of spatial and temporal distribution of gaseous emissions with the air flow in the indoor environment This work is also aimed at comparing the numerical simulation results of different CFD programs for a 2D base case model of indoor air flow with and without emission source under laminar and turbulent flow conditions for the purpose of developing a better basic understanding of the physical phenomena and for the selection of the suitable and appropriate CFD program for the further development of the simulation model One of the goals is also to apply the developed simulation model to the loss prevention and risk mitigation in the indoor environment and to study the influence of different parameters on the concentration distribution of gaseous pollutants in the presence of air flow in the indoor environment to minimize the expensive and time consuming experimentation efforts

A common feature of multiphase flows is that a dispersed or discontinuous phase is being carried by a continuous phase for example water drops in gas flow solid particles in water flow or gas bubbles in liquid flow The overall behavior of the flow is shaped largely by the interaction between the discontinuous elements drops particles bubbles

Catalog, 1989-08 **Improved Method for Determining Wind Loads on Highway Sign and Traffic-signal**

Structures George Constantinescu, Asghar Bhatti, Talia Tokyay, 2007 The main objective of the proposed study is to use

computational Fluid Dynamics CFD tools to determine the wind loads by accurate numerical simulations of air flow

characteristics around large highway sign structures under severe wind speeds conditions Fully three dimensional Reynolds

Averaged Navier Stokes RANS simulations are used to estimate the total force on different panels as well as the actual pressure distribution on the front and back faces of the panels. In particular, the present study investigates the effects of aspect ratio and sign spacing for regular panels, the effect of sign depth for the dynamic message signs that are now being used on Iowa highways, the effect induced by the presence of back to back signs, the effect of the presence of add on exit signs, and the effect of the presence of trucks underneath the signs, potentially creating a wind tunnel effect.
