Engineering Design Applications V Andreas Öchsner, Holm Altenbach, 2023-07-27 This book gives an update on recent developments in different engineering disciplines such as mechanical materials computer and process engineering focusing on modern engineering design applications These disciplines provide the foundation for the design and development of improved structures materials and processes The modern design cycle is characterized by an interaction of different disciplines and a strong shift to computer based approaches where only a few experiments are performed for verification purposes A major driver for this development is the increased demand for cost reduction which is also connected to environmental demands In the transportation industry e g automotive this is connected to the demand for higher fuel efficiency which is related to the operational costs and the lower harm for the environment One way to fulfill such requirements is lighter structures and or improved processes for energy conversion Another emerging area is the interaction of classical engineering with the health medical and environmental sector The chapters are selected contributions of the Advanced Computational Engineering and Experimenting conference held in July 2022 in Florence Italy

Surrogate-Based Modeling and Optimization Slawomir Koziel, Leifur Leifsson, 2013-06-06 Contemporary engineering design is heavily based on computer simulations. Accurate high fidelity simulations are used not only for design verification but even more importantly to adjust parameters of the system to have it meet given performance requirements. Unfortunately accurate simulations are often computationally very expensive with evaluation times as long as hours or even days per design making design automation using conventional methods impractical. These and other problems can be alleviated by the development and employment of so called surrogates that reliably represent the expensive simulation based model of the system or device of interest but they are much more reasonable and analytically tractable. This volume features surrogate based modeling and optimization techniques and their applications for solving difficult and computationally expensive engineering design problems. It begins by presenting the basic concepts and formulations of the surrogate based modeling and optimization paradigm and then discusses relevant modeling techniques, optimization algorithms and design procedures as well as state of the art developments. The chapters are self contained with basic concepts and formulations along with applications and examples. The book will be useful to researchers in engineering and mathematics in particular those who employ computationally heavy simulations in their design work.

Digital Twins for Aerospace Marco Evangelos Biancolini, Corrado Groth, Ubaldo Cella, 2026-01-01 This book presents a curated collection of works addressing topics on aerodynamic and structural design of aerospace systems with a particular emphasis on technologies that enhance the design process. A set of case studies illustrate how Digital Twins are used in supporting analyses and design of complex systems. Works developed within research environments, academia and industries contribute to provide an overview on the status of Digital Twins technology for aerospace applications. Examples in which the adoption of Reduced Order Models (ROM) support the generation of models that provide real time feedback on performance are provided. Aspects related to the accuracy of numerical models and the efficiency of optimisation techniques are also covered.

Electromagnetic Fields in Electrical Engineering Andrzej Krawczyk, S. Wiak, 2002 This volume includes contributions on field theory and advanced computational electromagnetics, electrical machines and transformers, optimization and interactive design, electromagnetics in materials, coupled field and electromagnetic components in mechatronics, induction heating systems, bioelectromagnetics and electromagnetics in education.

Altabay, Mohammad Noori, Libin Wang, 2018 Benchmark Composite Wing Design Including Joint Analysis and Optimization Robert G. Albers, 2014 A composite wing panel software package named WING Joint Optimization and Analysis WINGJOTA featuring bolted joint analysis is created and presented in this research Three areas of focus were the development of an analytic composite bolted joint analysis suitable for fast evaluation a more realistic wing design than what has been considered in the open literature and the application of two optimization algorithms for composite wing design Optimization results from 14 wing load cases applied to a composite wing panel with joints are presented The composite bolted joint analysis consists of an elasticity solution that provides the stress state at a characteristic distance away from the bolt holes The stresses at the characteristic distance are compared to a failure criterion on a ply by ply basis that not only determines first ply failure but also the failure mode The loads in the multi fastener joints used in this study were determined by an iterative scheme that provides the bearing bypass loads to the elasticity analysis A preliminary design of a composite subsonic transport wing was developed based around a mid size twin aisle aircraft The benchmark design includes the leading and trailing edge structures and the center box inside the fuselage Wing masses were included as point loads and fuel loads were incorporated as distributed loads The side of body boundary condition was modeled using high stiffness springs and the aerodynamic loads were applied using an approximate point load scheme The entire wing structure was modeled using the finite element code ANSYS to provide the internal loads needed as boundary conditions for the wing panel analyzed by WINGJOTA The software package WINGJOTA combines the composite bolted joint analysis a composite plate finite element analysis a wing aeroelastic cycle and two optimization algorithms to form the basis of a computer code for analysis and optimization Both the Improving Hit and Run IHR and the Multi Particle Simulated Annealing MPSA algorithms were coded and used as the optimization routines in WINGJOTA It was found that MPSA was able to find panel designs with lighter weights than IHR however the computation time was longer Using ANSYS for Finite Element Analysis, Volume II Wael A.
