Comparison Between SDP in Cloud PaaS and Traditional Hosting Platform Samuel Chinenyeze,2013 API centric cloud PaaS is concerned with cloud platform as a service delivery that provisions development and deployment tools specific to underlying cloud provider s infrastructure for developing cloud aware applications With the advent of API centric cloud PaaS and the new approach to software development it poses there still stands some uncertainties as to whether development processes for these platforms are same as traditional application development and deployment processes The significance of this work is evaluating and establishing a comparison of the software development process between the API centric cloud PaaS and traditional development platform following the MVC design pattern with comparison case studies as

Google App Engine and Glassfish respectively An experimental approach was adopted for this research and empirical results show that traditional development platform may require more processes at selected development stages and consequently more flexibility from an MVC perspective compared to API centric cloud PaaS development depending on the nature of requirement or deterministic factors [Cloud Foundry](#) Duncan C. A Platform as a Service for Concurrency-based Applications Provisioning in Internet of Things Deepak Kumar Aggarwal,2018 The Internet of Things IoT is becoming ubiquitous with

sensor nodes getting more intelligent and capable of transmitting their processed data to a cloud. Concurrency based applications play a vital role in the rise of the IoT. A concurrency based application has multiple processes running independently and interacting with each other. An example of the concurrency based application in IoT is wildfire management application. In a forest various sensor devices are deployed in the different areas. The processes of the wildfire management application are running on the sensor devices of different areas independently. The process of a particular area monitors the temperature and interacts with the processes in the neighboring areas. This interaction is based on the fire contour algorithm which allows the application to provide the real time direction and evolution of the fire in case of the fire incident. Cloud computing is a paradigm for swiftly provisioning a shared pool of configurable resources e.g. services, applications, network and storage on demand. Cloud computing can help to tackle the challenges of IoT based applications provisioning by offering the Platform as a Service (PaaS). Therefore developers of such concurrency based applications can use cloud's PaaS for faster development as well as cost efficiency. However the PaaS faces several challenges at the time of provisioning of concurrency based application i.e. development, deployment and management. For the concurrency based application development phase PaaS should support the various API and frameworks for the development of multiple processes of the concurrency based application which helps to start development quickly. For the deployment of the concurrency based application the PaaS must offer the facility of hosting of different processes in an isolated environment and enable process's edges to allow inter process communication. In management phase of the concurrency based application PaaS should be able to orchestrate the chain of processes defined during the development phase. The main intent of this dissertation is to provide a PaaS solution for concurrency based applications provisioning in IoT to solve the challenges as mentioned above. The major contributions of the thesis are in twofold. First we propose a PaaS architecture for concurrency based applications provisioning in IoT. Second we provide a proof of concept in which a prototype is built using as basis Cloud Foundry an existing PaaS platform and TelosB as the IoT Infrastructure devices. The performance measurements have also been made to validate the results claimed.
