

# Combining Motivational Interviewing and Cognitive Bias Modification Training for Substances in Detained Youth

Hans S. van der Baan, PhD , Annematt L. Collot D'Escury-Koenigs, PhD ,  
Raoul P.P.P. Grasman, PhD , Gerard M. Schippers, PhD , Reinout W. Wiers, PhD 

**Objective:** Motivation is considered a key factor in successful treatment. Unfortunately, detained youth typically show lower motivation for treatment and behavioral change. This pilot study examined the effects of a brief Motivational Interviewing (MI) protocol in conjunction with a Cognitive Bias Modification (CBM) intervention aimed at reducing substance use in detained youth.

**Method:** An MI protocol for adult parolees was adapted for adolescents. A total of 52 detained youth received the MI intervention, aimed at enhancing their insights into their substance use and its potential relation with their offenses, plus substance use treatment. These youth were matched with controls from similar populations who received the same CBM without MI.

**Results:** Changes in motivation over time were examined with a repeated-measures analysis of variance. Results showed no change in motivation over time, nor a significant effect of condition (MI vs no MI).

**Conclusion:** Although application of the MI protocol was feasible, no effect was found on motivation, in contrast to the original adult-focused protocol. Certain core facets of the original protocol, such as client reflection on their history of substance use, may be less applicable to detained youth whose use history is relatively brief. The severity of their substance use behavior should also be taken into account in any future applications.

**Plain language summary:** Motivational interviewing (MI) is an evidence-based method to increase behavioral change and treatment engagement. In this study, 52 detained youth received a 6 session MI protocol in addition to a cognitive bias modification (CBM) intervention targeting substance use, and they were matched with controls from a prior study where youth received CBM only. Neither group showed a change in motivation. These findings suggest that future MI-based interventions should consider the needs and developmental stages of youths with substance use.

**Key words:** young offenders; motivational interviewing; substances

JAACAP Open 2024;2(4):301-310. 

**C**lient motivation plays a pivotal role in mental health treatment,<sup>1-3</sup> being predictive of treatment retention and outcomes.<sup>4-7</sup> Creating and sustaining motivation is a recurring challenge for practitioners, particularly in forensic settings. Involuntary treatment is considered less effective,<sup>8-10</sup> yet successful treatment in forensic populations is greatly beneficial, both to the individual and to society. This is particularly true with detained youth,<sup>11</sup> who may potentially desist from continued involvement with the legal system. Motivation in detained youth is therefore of primary consideration for clinicians in treatment planning,<sup>12</sup> and effective motivation enhancement is needed.

Detained youth are often assumed to have little motivation for their treatment.<sup>13</sup> Optimally, motivation for engaging in treatment and/or behavioral change should be intrinsic or autonomous.<sup>14</sup> Adolescents in general derive motivation from personal relevance and perceived effects on social status, rather than long-term societal benefits.<sup>15,16</sup>

Detained youth typically have little to no autonomy in the decision to be treated or in the treatment selection. Unlike typical clinical populations, they have not arrived at treatment after a process of deliberation or because of problem recognition. Treatment initiation is highly controlled and engagement enforced extrinsically, as cooperation is often linked to privileges (or lack thereof) during detention. Moreover, their direct peers are other detained youth who may not react positively to cooperation with authority. This has a negative impact on motivation in what is already a suboptimal treatment environment.<sup>17</sup>

The most common conceptualization of motivation in clinical context is the Trans-theoretical Model (TTM)<sup>18</sup> of behavior change. The TTM sees motivation both as the initial motivation at treatment commencement and as a continuous factor throughout the process, as clients progress through 6 sequential stages. The first stage is Pre-contemplation, in which individuals do not intend to take action toward behavior change, at least not in the next 6
