Analysis of Continuous Curved Girder-slab Bridges, 1989 **Bridge Maintenance, Safety, Management, Life-Cycle Sustainability and Innovations** Hiroshi Yokota, Dan M. Frangopol, 2021-04-19 Bridge Maintenance Safety Management Life Cycle Sustainability and Innovations contains lectures and papers presented at the Tenth International Conference on Bridge Maintenance Safety and Management IABMAS 2020 held in Sapporo Hokkaido Japan April 11 15 2021 This volume consists of a book of extended abstracts and a multimedia device containing the full papers of 571 contributions presented at IABMAS 2020 including the T Y Lin Lecture 9 Keynote Lectures and 561 technical papers from 40 countries The contributions presented at IABMAS 2020 deal with the state of the art as well as emerging concepts and innovative applications related to the main aspects of maintenance safety management life cycle sustainability and technological innovations of bridges Major topics include advanced bridge design construction and maintenance approaches safety reliability and risk evaluation life cycle management life cycle sustainability standardization analytical models bridge management systems service life prediction maintenance and management strategies structural health monitoring non destructive testing and field testing safety resilience robustness and redundancy durability enhancement repair and rehabilitation fatigue and corrosion extreme loads and application of information and computer technology and artificial intelligence for bridges among others This volume provides both an up to date overview of the field of bridge engineering and significant contributions to the process of making more rational decisions on maintenance safety management life cycle sustainability and technological innovations of bridges for the purpose of enhancing the welfare of society The Editors hope that these Proceedings will serve as a valuable reference to all concerned with bridge structure and infrastructure systems including engineers researchers academics and students from all areas of bridge engineering **Canadian Journal of Civil Engineering**, 2002 **Civil-Comp 87** B. H. V. Topping, 1987 **Behavior, Design and Construction of Horizontally Curved Composite Steel Box Girder Bridges [microform]** Muayad Whyib Aldoori, 2004 Horizontally curved girder bridges have been used considerably in recent years in highly congested urban areas However although significant research on physical testing and advanced analysis has been underway for the past decade the practical employment of many recommendations has not been achieved by the engineering community nor have standards reflecting this work been brought into practice The design process of curved composite bridges involves tracking the stresses and the potential failure change in the girders during erection construction and service loading stages For structural safety and serviceability the designer estimates the stresses induced within the bridge and assure that they do not exceed the applicable specified limit state as required in bridge design standards However the designer may be concerned about the level of approximation that is used in his estimate or even the applicability of the underlying theory To answer this question and provide the designer with more insight into the behavior of the curved bridges the field testing during construction and service loading of a curved bridge located near Baltimore Maryland is re examined

here using linear elastic three dimensional finite element modeling Comparisons are made between the finite element results and the measured results Finally to facilitate the finite element modeling effort for use by a designer ANSYS Parametric Design Language APDL capabilities are used here to develop an analysis design tool for Bath Tub style curved steel girder bridges This tool is then used to evaluate the effects of several important design variables on the response and behavior of the girders during the construction phase This study demonstrates the ability of finite element modeling to assess the stiffness serviceability performance buckling behavior and ultimate strength of curved bridges during construction and it is a major step towards a performance based approach to design for stability The level of safety or reliability that would be available during the erection and the construction processes of horizontally curved girder bridges represents another major concern for the designer A three span continuous curved box girder bridge in Houston Texas is used in this study as an example reflecting current detailing and fabricating practice and it is chosen for a detailed evaluation of the structural safety reliability during the erection and construction process This task involves simulating the girder erection and concrete slab placement sequence of the bridge using comprehensive nonlinear three dimensional finite element modeling
