The design and construction of building projects is a complex and demanding process. It involves a variety of disciplines including architecture, quantity surveying, engineering, and construction management. The common objective is to deliver on behalf of clients, commissioning construction work, buildings of the right quality, at the right price, and within the right time scale. This introductory textbook explains the development, application, and pivotal role of design cost management from inception through to completion of a project, and considers its context and relevance within current construction procurement arrangements, including design and build. The text discusses the need for improvements in communication between all those involved in the process, and outlines how to achieve better information management, underpinned by information technology, to help overcome the criticisms of the industry for too often delivering projects late, over budget, and of poor quality. *Building Design Cost Management* will benefit all those involved in the design and construction of buildings, in particular students of

architecture quantity surveying and construction management as it takes an innovative approach to explain the process of design cost management using a practical case study to demonstrate its application supported by a dedicated website [www.bdc.co.uk](http://www.bdc.co.uk) includes on the website selective information from the nationally available Building Cost Information Service to give students a dynamic modelling tool to examine and carry out design cost management

Patel,1990 The primary objective of Cost Estimating is to support the timely generation of bid or alternative estimates Cost Estimating also supports management analysis of estimate accuracy reasonableness and project risk through the generation of summary reports and analysis Estimates also provide a base of information during construction for such items as scope changes to the contract variations in costs of the project cost total project cost feedback for scheduling etc

Construction cost estimating is the process of identifying and compiling the many items of cost that will enter into a construction project This is a procedure that requires very detailed study of the project during the different construction stages combined with an intimate knowledge of the availability characteristics and cost of materials equipment labor

Construction cost estimates becomes useful for different activities during the construction of the project such as

- 1 Procurement the selection and purchase of materials equipment labor for individual work items during construction of the project
- 2 Change orders during construction due to alterations in the original contract delays in the construction due to unavoidable reasons or any other problems occurring between the Owner and Contractor Estimating is used to determine the increase or decrease in the amount of the original contract or involve no change
- 3 Back charges charges for materials equipment labor or other costs furnished to the Contractor by the Owner to the Contractor by the Architect Engineer or to a Sub contractor Vendor by the Contractor due to defective incomplete or unsatisfactory work during construction This requires the preparation of an estimated cost of the back charge work so that the Owner or Contractor can have information regarding the dollar amount of back charges
- 4 Use of

Construction cost estimating becomes helpful in determining the financial position of the project by determining the total cost of work items completed to date the cost of work required to complete and projected final costs so that one can determine whether there will be a project underrun or overrun Also it becomes useful to determine the payment to be made to the Contractor by the Owner for the executed work so that he has sufficient information concerning the cashflow for the entire project This also provides relative information to scheduling systems for manpower planning and resource evaluation Estimating also plays an important role in providing information for the cost control of the project Estimating and cost control are the two most important tasks a Contractor performs to develop equipment labor production rates for each and every work item of the project during construction and for the selection of labor and equipment Also estimating becomes

useful to keep the cost of an on going project within the established budget      **Construction Cost Management** Adek Apfelbaum,2002      *Project Control* Wayne J.
