minimize total vehicle and inventory related costs First a decomposition strategy transforms the model formulation P into an equivalent formulation P In P the vehicle flow variables may be found as function of the commodity flow variables furthermore the vehicle capacity constraints need not be explicitly considered The decomposition however creates a situation whereby a commodity's incremental cost function on a given arc may contain concave and or convex portions This feature implies the presence of numerous local optima over which an exhaustive search for a global optimum is computationally infeasible Computational results from a series of test problems measure solution quality and algorithm efficiency SDW
