Cyber Weaponry Henry Prunckun,2018-04-04 There is little doubt that cyber space has become the battle space for confrontations However to conduct cyber operations a new armory of weapons needs to be employed No matter how many or how sophisticated an aggressor s kinetic weapons are they are useless in cyber space This book looks at the milieu of the cyber weapons industry as well as the belligerents who use cyber weapons It discusses what distinguishes these hardware devices and software programs from computer science in general It does this by focusing on specific aspects of the topic contextual issues of why cyber space is the new battleground defensive cyber weapons offensive cyber weapons dual use weapons and the implications these weapons systems have for practice Contrary to popular opinion the use of cyber weapons is not limited to nation states though this is where the bulk of news reporting focuses The reality is that there isn t a sector of the political economy that is immune to cyber skirmishes So this book looks at cyber weapons not only by national security agencies and the military but also by law enforcement and the business sector the latter includes administrations termed non government organisations NGOs This book offers study material suitable for a wide ranging audience students professionals researchers policy officers and ICT specialists

Recent Advances in Robot Learning Judy A. Franklin, Tom M. Mitchell, Sebastian Thrun,2012-12-06 Recent Advances

in Robot Learning contains seven papers on robot learning written by leading researchers in the field. As the selection of papers illustrates, the field of robot learning is both active and diverse. A variety of machine learning methods ranging from inductive logic programming to reinforcement learning is being applied to many subproblems in robot perception and control, often with objectives as diverse as parameter calibration and concept formulation. While no unified robot learning framework has yet emerged to cover the variety of problems and approaches described in these papers and other publications, a clear set of shared issues underlies many robot learning problems. Machine learning when applied to robotics is situated; it is embedded into a real world system that tightly integrates perception, decision making, and execution. Since robot learning involves decision making, there is an inherent active learning issue. Robotic domains are usually complex, yet the expense of using actual robotic hardware often prohibits the collection of large amounts of training data. Most robotic systems are real time systems. Decisions must be made within critical or practical time constraints. These characteristics present challenges and constraints to the learning system. Since these characteristics are shared by other important real world application domains, robotics is a highly attractive area for research on machine learning. On the other hand, machine learning is also highly attractive to robotics. There is a great variety of open problems in robotics that defy a static, hand-coded solution.

Recent Advances in Robot Learning is an edited volume of peer reviewed original research comprising seven invited contributions by leading researchers. This research work has also been published as a special issue of Machine Learning, Volume 23, Numbers 2 and 3.
