Cloud computing a term whose origins have been in existence for more than a decade has come into fruition due to technological capabilities and marketplace demands Cloud computing can be defined as a scalable and flexible shared computing solution in which third party suppliers use virtualization technologies to create and distribute computing resources to customers on demand via the Internet browser Cloud computing is steadily replacing more rigid software and services licensing models in both small medium business SMB and in the enterprise This analysis poses a twofold examination of cloud computing as a disruptive technology First cloud computing has replaced existing software and services licensing business models owing to its scalability flexibility and utility based pricing Second as cloud computing takes hold as the prominent computing services business paradigm other disruptive forces will surface to further integrate and differentiate the cloud computing landscape These forces include the customer driven need to create hybrid clouds between private and public cloud domains vendor agnostic solutions in the cloud along with open standards to make cloud computing ubiquitous Three criteria are assessed in characterizing cloud computing as a disruptive technology Christensen 2002 1 First cloud computing as an innovation must enable less skilled and or less wealthy individuals to receive the same utility as only the more skilled and or more wealthy intermediaries could formerly attain Second cloud computing must target customers at the low end of a market with modest demands on performance but with a performance trajectory capable of exceeding those demands and thus taking over markets tier by tier As a corollary to this second criterion the cloud computing business model allows the disruptive innovator to achieve attractive returns at prices that are unattractive to the incumbents Third an ecosystem in the form of a fully integrated single entity or a set of modular entities is required to successfully support the disruptive innovation The analysis has shown that cloud computing is replacing traditional outsourcing and premise based data centers for software applications and services delivery Scalability flexibility virtualization and cost are essential business drivers However current cloud computing solutions especially in the enterprise lack sufficient security and customer control This gives rise to numerous subordinate disruptive business solutions which enable the enterprise and emerging demographics to develop and deploy their applications and services in a secure controlled profitable and ubiquitous environment Computing Explained ,1996*
