- 1 By a floating structure.
- 2 To attach the base to the seabed
- 3 Ships would carry them
- 4 Collisions between the cable and space debris
- 5 The anchors would be raised and the station would be moved.

9a

Suggested answer

The anchoring system

The wind loads on the cable will be huge. What are the implications for the anchoring system? The base will need to be moved continuously and sometimes urgently. What temporary system could be used to hold the base in position? Should the base be in shallow water near the coast, or in deep water further offshore? The choice will have an impact on the design of the anchor system.

The propulsion system

Will the weight of the cable allow the base to be moved by its own propellers, or will a more powerful system for propulsion and control be required? For example, an external power source.

b

Suggested answers

Anchor system

It will be possible to anchor the base more securely in shallow water near the coast. A permanent anchor structure could be built on the ocean bed, in shallow water. The base station could then be fixed securely to it with cables. If several anchor structures are built at different locations along the coast, the base station can be moved between them.

Propulsion system

Two powerful boats used for pulling them could be used as an external power source. However, the base station could be driven by its own propellers. The large, powerful engines needed to propel it would be heavy, but that isn't necessarily a disadvantage, as extra mass, and therefore extra inertia, would help to make the base more stable.

There are two types of pile foundation: end-bearing piles and friction piles. Essentially, end-bearing piles are used when you have soft ground which is on top of hard ground or rock. Basically, the piles go through the soft ground and sit on the hard ground below. It's a bit like building over water. The soft ground is like water, which can't support anything, and the hard ground below it is like the seabed. Put simply, the piles are like stilts. Friction piles are different. They're used when there's no hard ground. In simple terms, the sides of the pile grip the soft ground around them. If you picture a nail in a piece of wood, it's the same thing. The nail is gripped by the wood around it. Sometimes the bottoms of friction piles are made wider. Imagine a leg with a foot at the bottom, it's the same principle.
