# Beginner's Guide to Coding: No Experience Necessary

**Abstract**

This tutorial consists of a brief overview of some basic computer knowledge and jargon, followed by a tutorial for creating a plot of star formation rate vs stellar mass taken from galaxies in the 3D-HST Treasury program. In addition to this, I am hoping to tackle some of the most common mistakes and obstacles encountered by undergraduate students with no background in computer science or coding language whatsoever. I start by covering the basic skills, such as orienting oneself in a computer system using a terminal, defining and using different files and directories, and knowing the difference between a terminal and a python shell. I will then demonstrate different simple plotting techniques in a Jupyter notebook, with an example plot which contains a sub-panel with color-coded data.

**Introduction**

Learning to code may seem like a daunting and overwhelming task to tackle head-on (which, let's be honest, it sometimes is). Granted, it is a frustrating process with a steep learning curve and you will inevitably make many mistakes. But the reward when you are able to execute code on your own is extremely gratifying. In this tutorial, I will attempt to help you navigate some of the more common mistakes and misconceptions that first-time coders experience. The purpose of this tutorial is to walk you through some of the basics step-by-step to leave no room for misconception.

First things first: the best way to learn is by doing! Let's start by locating and opening a terminal. Depending on the computer, this could be in a couple of different places so I will go over two separate scenarios (Mac vs Windows):

<u>Mac:</u>

The terminal on my own macbook is typically located at the bottom right of my dock and looks like a little winky face missing an eye >_<

If you have *never* opened a terminal on your computer, you may have to open up your launchpad which should be at the bottom left of your computer screen and is depicted with this symbol:
