Viscoelasticity of Polymers Kwang Soo Cho, 2016-05-30 This book offers a comprehensive introduction to polymer rheology with a focus on the viscoelastic characterization of polymeric materials It contains various numerical algorithms for the processing of viscoelastic data from basic principles to advanced examples which are hard to find in the existing literature The book takes a multidisciplinary approach to the study of the viscoelasticity of polymers and is self contained including the essential mathematics continuum mechanics polymer science and statistical mechanics needed to understand the theories of polymer viscoelasticity It covers recent achievements in polymer rheology such as theoretical and experimental aspects of large amplitude oscillatory shear LAOS and numerical methods for linear viscoelasticity as well as new insights into the interpretation of experimental data Although the book is balanced between the theoretical and experimental aspects of polymer rheology the author's particular interest in the theoretical side will not remain hidden Aimed at readers familiar with the mathematics and physics of engineering at an undergraduate level the multidisciplinary approach employed enables researchers with various scientific backgrounds to expand their knowledge of polymer rheology in a systematic way

Polymer-Improved Oil Recovery K.S. Sorbie, 2013-11-21 The importance of oil in the world economy cannot be overstated and methods for recovering oil will be the subject of much scientific and engineering research for many years to come Even after the application of primary depletion and secondary recovery processes usually waterflooding much oil usually remains in a reservoir and indeed in some heterogeneous reservoir systems as much as 70% of the original oil may remain Thus there is an enormous incentive for the development of improved or enhanced methods of oil recovery aimed at recovering some portion of this remaining oil The

techniques used range from improved secondary flooding methods including polymer and certain gas injection processes through to enhanced or tertiary methods such as chemical surfactant caustic foam gas miscible carbon dioxide gas reinjection and thermal steam soak and drive in situ combustion The distinction between the classification of the methods usually refers to the target oil that the process seeks to recover That is in improved recovery we are usually aiming to increase the oil sweep efficiency whereas in tertiary recovery we aim to mobilise and recover residual or capillary trapped oil There are a few books and collections of articles which give general overviews of improved and enhanced oil recovery methods However for each recovery method there is such a wide range of interconnected issues concerning the chemistry physics and fluid mechanics of flow in porous media that rarely are these adequately reviewed
