*An Evaluation of the Johnson-Cook Model to Simulate Puncture of 7075 Aluminum Plates*, 2014 The objective of this project was to evaluate the use of the Johnson Cook strength and failure models in an adiabatic finite element model to simulate the puncture of 7075 T651 aluminum plates that were studied as part of an ASC L2 milestone by Corona et al 2012 The Johnson Cook model parameters were determined from material test data The results show a marked improvement in particular in the calculated threshold velocity between no puncture and puncture over those obtained in 2012 The threshold velocity calculated using a baseline model is just 4% higher than the mean value determined from experiment in contrast to 60% in the 2012 predictions Sensitivity studies showed that the threshold velocity predictions were improved by calibrating the relations between the equivalent plastic strain at failure and stress triaxiality strain rate and temperature as well as by the inclusion of adiabatic heating

plasticity heat generation and dissipation material damage and surface interactions in three dimensions High strain rate experimental results are usually done by using Split Hopkinson Pressure Bar SHPB Since these experiments have limitation on the maximum strain rate applied to the sample there is no accurate data for the flow stress of the material at the high rates encountered in CS Therefore in this thesis a computational material model calibration has been performed for the Bilinear JC model for the HSR applications The optimization process uses the method of steepest descent to find the best constants in the Bilinear JC constitutive law The difference between ellipticity ratio of the deformed particle in simulation and experiments is used as the objective function and the parameters of the Bilinear JC equation are modified until the objective function is satisfied The optimized bilinear Johnson Cook model was used to simulate the deformed shape of particles The results show a very good agreement between the simulations and single particle impact experiments The optimized bilinear JC model was further verified by comparing simulation results of the particle rebound velocity and the coefficient of restitution COR to experimental data The methodology developed in this thesis can be used to develop the model parameters for different materials and other HSR material models
