Practical Algorithms For Programmers Dmwood:

Practical Algorithms George Richard Yool, 2014-06-13 An algorithm is a solution to a class of problems generally contained in programming unit called a module and accessed by one or more objected oriented programs A class on algorithms is a class on problem solving with the expectation of marketable results This requires a textbook that actually provides problem solving tools Solving the problems is hard enough The tools should be the easy part Practical Algorithms provides a complete toolbox from meeting the client to rolling out a scalable solution fitting the client s needs The typical algorithms text focuses on pseudocode which at best lays out business rules and at worst solves nothing As such pseudocode is given minimal attention Using MCSE MCSD and other marketable standards as a basic guideline this text applies practical experiences in the field and classroom to make this extremely difficult material as simple as possible This book took a failed class at multiple institutions made the concepts accessible and led every student to not only succeed in the class but to have what they needed in their careers The first subject created a line of grateful engineers and project managers on the first day of class The subject sales from meet and greet to proposal and contract writing to closing the deal Every class meeting we systematically explored vital elements to breaking down and solving problems from system and network architectures to hard coding and n tiered databases This book turned a failed class into a success story

Algorithms Andy Vickler,2021-12-21 Do you want to know what makes a programmer confident about the code they write Do you want to learn how programmers use algorithms to determine how to structure their programs before they develop it If you did this is the book for you

Introduction to Algorithms Michael David,2021-01-04 This book covers techniques for the design and analysis of algorithms The algorithmic techniques covered include divide and conquer backtracking dynamic programming greedy algorithms and hill climbing Any solvable problem generally has at least one algorithm of each of the following types 1 the obvious way 2 the methodical way 3 the clever way and 4 the miraculous way On the first and most basic level the obvious solution might try to exhaustively search for the answer Intuitively the obvious solution is the one that comes easily if you re familiar with a programming language and the basic problem solving techniques The second level is the methodical level and is the heart of this book after understanding the material presented here you should be able to methodically turn most obvious algorithms into better performing algorithms The third level the clever level requires more understanding of the elements involved in the problem and their properties or even a reformulation of the algorithm e g numerical algorithms exploit mathematical properties that are not obvious A clever algorithm may be hard to understand by being non obvious that it is correct or it may be hard to understand that it actually runs faster than what it would seem to require The fourth and final level of an algorithmic solution is the miraculous level this is reserved for the rare cases where a breakthrough results in a highly non intuitive solution Naturally all of these four levels are relative and some clever algorithms are covered in this book as well in addition to the methodical techniques Let s begin
