Distributed Algorithm For Shortest Path Problem In:

A Distributed Shortest - Path Algorithm Pierre A. Humblet, MASSACHUSETTS INST OF TECH CAMBRIDGE ELECTRONIC SYSTEMS LAB., 1978 The problem of routing in a data network is often treated by assigning traffic dependent lengths to the links of the network and routing traffic from node i to node j along the shortest path from i to j A distributed algorithm is presented in which the nodes cooperate to find all shortest paths It runs asynchronously in every node and does not require the network topology or even the number of nodes in the network to be known a priori by the nodes

Introduction to Distributed Algorithms Gerard Tel, 2000-09-28 Distributed algorithms have been the subject of intense development over the last twenty years The second edition of this successful textbook provides an up to date introduction both to the topic and to the theory behind the algorithms The clear presentation makes the book suitable for advanced undergraduate or graduate courses whilst the coverage is sufficiently deep to make it useful for practising engineers and researchers The author concentrates on algorithms for the point to point message passing model and includes algorithms for the implementation of computer communication networks Other key areas discussed are algorithms for the control of distributed applications wave broadcast election termination detection randomized algorithms for anonymous networks snapshots deadlock detection synchronous systems and fault tolerance achievable by distributed algorithms The two new chapters on sense of direction and failure detectors are state of the art and will provide an entry to research in these still developing topics

A Comparison of Two Distributed Shortest Path Algorithms Based on Dijkstra's Algorithm Jesper Larsson Träff, Københavns Universitet. Datalogisk Institut, 1993 Abstract This report experimentally compares two distributed implementations of Dijkstra's algorithm for the single source shortest path problem Both are intended for distributed systems consisting of a fixed small number of processors without shared memory that communicate by message passing Communication is assumed to be costly Both algorithms efficiently utilize distributed memory ie for graphs with n vertices and m edges the total space consumption per processor is $O(m/p)$ Dijkstra's algorithm maintains a tentative distance for all vertices in the given graph and repeatedly selects a vertex of minimum tentative distance from which it updates the tentative distance of adjacent vertices In the update driven algorithm updates from a selected vertex are performed by only one processor but more than one vertex may be selected at any instant Speed up depends on the problem instance and no worst case guarantee better than the sequential algorithm can be given In the minimum driven algorithm updates from a selected vertex are done by the processors in parallel Ideally this algorithm has linear speed up for dense graphs but this is compromised by the fact that the selected vertex has to be broadcast to all processors before they can proceed with the update Implemented naively both algorithms perform poorly However both can be improved by appropriate relaxations and local approximations to the global state which serve to cut down on communication volume Surprisingly the theoretically less attractive update driven algorithm turns out to perform much better than the apparently better minimum

driven algorithm The algorithms have been implemented in OCCAM and results from experiments performed on a 16 processor transputer system with randomly generated graphs of different types with up to 20000 vertices and 250000 edges are reported For the update driven algorithm speed up of about 4 has been achieved for random unstructured graphs whereas the minimum driven exhibited slow down For grid graphs with shortest paths crossing many processor boundaries slow down could almost be avoided with the update driven algorithm The minimum driven algorithm exhibited a considerable slow down in this case

Distributed Algorithms Sam Toueg, Paul G. Spirakis, Lefteris Kirousis, 1992-03-11 This volume contains the proceedings of the fifth International Workshop on Distributed Algorithms WDAG 91 held in Delphi Greece in October 1991 The workshop provided a forum for researchers and others interested in distributed algorithms communication networks and decentralized systems The aim was to present recent research results explore directions for future research and identify common fundamental techniques that serve as building blocks in many distributed algorithms The volume contains 23 papers selected by the Program Committee from about fifty extended abstracts on the basis of perceived originality and quality and on thematic appropriateness and topical balance The workshop was organized by the Computer Technology Institute of Patras University Greece

Path Problems in Networks John Baras, George Theodorakopoulos, 2022-06-01 The algebraic path problem is a generalization of the shortest path problem in graphs Various instances of this abstract problem have appeared in the literature and similar solutions have been independently discovered and rediscovered The repeated appearance of a problem is evidence of its relevance This book aims to help current and future researchers add this powerful tool to their arsenal so that they can easily identify and use it in their own work Path problems in networks can be conceptually divided into two parts A distillation of the extensive theory behind the algebraic path problem and an exposition of a broad range of applications First of all the shortest path problem is presented so as to fix terminology and concepts existence and uniqueness of solutions robustness to parameter changes and centralized and distributed computation algorithms Then these concepts are generalized to the algebraic context of semirings Methods for creating new semirings useful for modeling new problems are provided A large part of the book is then devoted to numerous applications of the algebraic path problem ranging from mobile network routing to BGP routing to social networks These applications show what kind of problems can be modeled as algebraic path problems they also serve as examples on how to go about modeling new problems This monograph will be useful to network researchers engineers and graduate students It can be used either as an introduction to the topic or as a quick reference to the theoretical facts algorithms and application examples The theoretical background assumed for the reader is that of a graduate or advanced undergraduate student in computer science or engineering Some familiarity with algebra and algorithms is helpful but not necessary Algebra in particular is used as a convenient and concise language to describe problems that are essentially combinatorial Table of Contents Classical Shortest Path The Algebraic Path Problem Properties and Computation of Solutions Applications Related

Murthy, 1994 Route assignment is one of the operational problems of communication network and adaptive routing schemes are required to achieve real time performance This thesis introduces verifies and analyses two new distributed shortest path routing algorithms which are called Path Finding Algorithm PFA and Loop Free Path Finding Algorithm LPA Both algorithms require each routing node to know only the distance and the second to last hop or predecessor node to each destination In addition to the above information LPA uses an efficient inter neighbor coordination mechanism spanning over a single hop PFA reduces the formation of temporary loops significantly while LPA achieves loop freedom at every instant by eliminating temporary loops The average performance of these two algorithms is compared with the Diffusing Update Algorithm DUAL and an ideal link state ILS using Dijkstra s shortest path algorithm by simulation this performance comparison is made in terms of time taken for convergence number of packets exchanged and the total number of operations required for convergence by each of the algorithms The simulations were performed using a C based simulation tool called Drama along with a network simulation library The results indicated that the performance of PFA is comparable to that of DUAL and ILS and that a significant improvement in performance can be achieved with LPA over DUAL and ILS
