**CHAPTER 2
MATERIALS IN MECHANICAL DESIGN**

1. Ultimate tensile strength is the apparent stress at the peak of the stress-strain curve.
2. Yield point is the value of the apparent stress from the stress-strain curve at which there is a large increase in strain with no increase in stress. It is the point where the stress-strain curve exhibits a horizontal slope.

Yield strength is the apparent stress from the stress-strain curve at which there is a large increase in strain with little increase in stress for materials that do not exhibit a yield point. The offset method is used by drawing a line parallel to the straight part of the stress-strain curve through a value of 0.2% on the strain axis.
3. Many low alloy steels exhibit a yield point.
4. The proportional limit is the apparent stress on the stress-strain curve at which the curve deviates from a straight line. At this value, the material is usually still elastic. The elastic limit is the apparent stress at which the material is deformed plastically and will not return to its original size and shape.

Hooke's law applies to that portion of the stress-strain curve that is a straight line for which stress is proportional to strain.
5. The modulus of elasticity is a measure of the stiffness of a material.
6. The modulus of resilience is a measure of the energy absorbed per unit volume of a material up to the elastic limit.
7. The modulus of toughness is a measure of the energy absorbed per unit volume of a material up to the point of fracture.
