Dynamic Reservoir Simulation Of The Alwyn Field Using Eclipse:

Reservoir Simulation Study of an Oil Field Ahmed Elshabani,2015 **Applied Reservoir Simulation of Farnsworth Field, Texas** Kewei Chen,2013 **Reservoir Simulation** Calvin C. Mattax,Robert L. Dalton,1990 Reservoir Simulation written by experienced simulation users was designed to help demystify the what s and whys of designing editing and analyzing reservoir simulations Petroleum Reservoir Simulation ,1986 Reservoir Simulation Study for the South Slattery Field Linna Wang,2007 A detailed understanding of the reservoir in the successful operation of mature oil fields is so essential that can be used to determine the optimum recovery method However reservoir management and characterization has seldom been carried out by small and medium operators due to lack of reservoir data and technical personnel Babadagli 2005 There are thousands of oil and gas fields in mature basins that haven t had the benefit of more detailed study In this study ECLIPSE is used to simulate the South Slattery Field validated by the history match on primary production Our goal is to build a general reservoir simulation model for the South Slattery Field which can be applied for the further recovery process This study will assist in making decisions on the further recovery scheme and operations Based on a satisfactory history match result it is concluded that the primary drive mechanism is water influx which accounts for 95% and other mechanisms including rock compaction and oil expansion have a 5% contribution Since there is very little gas dissolved in the reservoir fluid the gas drive mechanism can be ignored After more than 40 years production the field oil recovery has reached 30% which implies the reservoir still has plenty of remaining oil in place 10 71MMSTB that would be suitable for some other form of enhanced oil recovery It has been determined that the infill drilling strategy is an effective method that could be taken to enhance oil recovery The field oil recovery could be enhanced from 34% to almost 40% in the next 10 years The preliminary result of the polymer flood for the South Slattery Field also draws a promising conclusion the field oil recovery can be enhanced from 34% to 37% in the next 10 years and the water cut can be greatly reduced within the first several years It is recommended that additional reservoir parameters be collected and a more detailed study be implemented because of the large potential for additional oil recovery indicated by this reservoir study **ECLIPSE Blackoil Reservoir Simulation** ,2010 **Advances in Reservoir Simulation** Haifeng Zhao,Yang Xia,2025-05-07 This synthesis highlights innovations addressing reservoir heterogeneity and fracture dynamics through integrated numerical modeling data assimilation and multi physics coupling Ensemble based algorithms e g ES MDA enhance history matching by assimilating 4D seismic and production data reducing uncertainties by 15 20% Hydro mechanical models optimized with true triaxial experiments guide Discrete Fracture Network DFN driven hydraulic fracturing boosting shale gas productivity by 40% Proxy models like INSIM FT and Physics Informed Neural Networks PINNs enable rapid simulation cutting computational time from weeks to hours while maintaining 85% accuracy Machine learning XGBoost achieves 92% permeability prediction in carbonates while dynamic heterogeneity analysis reveals fracture induced permeability contrasts exceeding 103

Geomechanical frameworks quantify risks in salt cavern storage 0 12% annual creep strain and fractured reservoirs extending operational lifespans by 20% Field applications demonstrate 8% recovery gains in carbonate fields via 4D seismic integration and 60% leakage risk reduction through multi physics cement design Emerging trends fuse data physics models 30 50% efficiency gains and cross scale simulations while challenges persist in proppant transport modeling and sparse 4D data Future directions prioritize quantum computing for fracture networks IoT enabled digital twins and adapting reservoir engineering to carbon sequestration positioning the field as pivotal for sustainable energy transition

Zee Ma,Paul R. La Pointe,2011-12-20 [Reservoir Simulation and Evaluation of the Azal Field in Yemen](#) Sammy Sallam,1996 [Integration of Dynamic Data Into Reservoir Description Using Streamline Approaches](#) Zhong He,2003 Integration of dynamic data is critical for reliable reservoir description and has been an outstanding challenge for the petroleum industry This work develops practical dynamic data integration techniques using streamline approaches to condition static geological models to various kinds of dynamic data including two phase production history interference pressure observations and primary production data The proposed techniques are computationally efficient and robust and thus well suited for large scale field applications We can account for realistic field conditions such as gravity and changing field conditions arising from infill drilling pattern conversion and recompletion etc during the integration of two phase production data Our approach is fast and exhibits rapid convergence even when the initial model is far from the solution The power and practical applicability of the proposed techniques are demonstrated with a variety of field examples To integrate two phase production data a travel time inversion analogous to seismic inversion is adopted We extend the method via a generalized travel time inversion to ensure matching of the entire production response rather than just a single time point while retaining most of the quasi linear property of travel time inversion To integrate the interference pressure data we propose an alternating procedure of travel time inversion and peak amplitude inversion or pressure inversion to improve the overall matching of the pressure response A key component of the proposed techniques is the efficient computation of the

sensitivities of dynamic responses with respect to reservoir parameters These sensitivities are calculated analytically using a single forward simulation Thus our methods can be orders of magnitude faster than finite difference based numerical approaches that require multiple forward simulations Streamline approach has also been extended to identify reservoir compartmentalization and flow barriers using primary production data in conjunction with decline type curve analysis The streamline diffusive time of flight provides an effective way to calculate the drainage volume in 3D heterogeneous reservoirs The flow barriers and reservoir compartmentalization are inferred based on the matching of drainage volumes from streamline based calculation and decline type curve analysis The proposed approach is well suited for application in the early stages of field development with limited well data and has been illustrated using a field example from the Gulf of Mexico

Reservoir Simulation Study of Ben Kahla Field, Algeria Adel Achi,2005 **Use of Streamline Simulation in Large Scale Reservoir-geomechanical Modeling of Reservoirs** Behrooz Koohmareh Hosseini,2015 The increasing demand for hydrocarbons and decreasing reserves have created the necessity to produce oil and gas more efficiently and economically Increasingly oil and gas companies are focusing on unconventional hydrocarbons oil sands shales and CBM For this class of reservoir materials the geomechanical response of the reservoir can play an important role in the recovery process For naturally fractured stress sensitive reservoirs or thermal recovery processes geomechanical processes play an even greater role in efficient economic recovery For simulations of these processes most research efforts have been focused on reservoir geomechanical simulations using conventional reservoir simulators coupled to geomechanical codes While coupled reservoir geomechanics modeling has been recently widely studied in the literature there is no applicable methodology implemented or proposed to mitigate the challenging computational cost involved with the inclusion of geomechanics in large multimillion cell reservoirs Past studies so far have focused on different coupling schemes but not on the efficient and robust simulation workflows This research was conducted with the aim of development and application of various different strategies to include geomechanics into reservoir simulation workflows in large scale reservoirs and in a timely fashion process The research was performed to allow the future simulators to perform high resolution reservoir geomechanical simulations in a large scale near field and far field with long simulation time windows and lowest computational cost Initially analytical proxies were developed and recommending for implementation in lieu of complex reservoir simulations The analytical model was for prediction of heavy oil geomechanical responses everywhere in the reservoir The model adopted the use of the mathematical domain decomposition technique and a novel temperature front tracking developed in the very early stage of the research As opposed to classical analytical models the proxy predicted reservoir flow and mechanical behavior on a synthetic case geometry with real hydraulic data everywhere in the reservoir and in dynamic and transient flow regimes Subsequent research was aimed at reservoir geomechanics coupled model order reduction by use of a numerical proxy The proxy took advantage of streamline linear space behavior and power in

decomposition of the reservoir domain into sub systems delineation drainage areas The combination of localization and linearization allowed predicting both mechanical and fluid flow responses of the reservoir with only solving the pressure equation in Cartesian underlying 3D grids and the solution of saturation transport equation along only one streamline Following this a streamline based reservoir geomechanics coupling was proposed and was implemented within a Fortran C based platform The new developed technique was compared in terms of computational cost and results accuracy with the conventional hydromechanical coupling strategy that was developed on a C based platform by use of collocated FV FEM discretization scheme One of the final stages of the research explored different streamline based reservoir geomechanics coupling strategies for full field reservoir simulations Various coupling strategies including sequential coupling schemes and a semi fully coupling scheme to embed geomechanics into streamline simulation workflow was developed and performed Numerical software with advanced GUI was coded on QT programming language C based developed to couple mechanical simulator to streamline simulation engine While streamline simulations were the center of the research the last stage of research was conducted on numerical and physical stability convergence and material balance errors of SL based reservoir geomechanics class of couplings The results provided a solid foundation for proper selection of time steps in SL based coupling to ensure a numerically stable and physically robust hydromechanical simulation As a result we showed that use of streamline simulation in both proxy forms and simulator forms have significant added value in full field reservoir geomechanics simulations

Abou-Kassem, 2016-07-18 This second edition of the original volume adds significant new innovations for revolutionizing the processes and methods used in petroleum reservoir simulations With the

advent of shale drilling hydraulic fracturing and underbalanced drilling has come a virtual renaissance of scientific methodologies in the oil and gas industry New ways of thinking are being pioneered and Dr Islam and his team have for years now been at the forefront of these important changes This book clarifies the underlying mathematics and physics behind reservoir simulation and makes it easy to have a range of simulation results along with their respective probability This makes the risk analysis based on knowledge rather than guess work The book offers by far the strongest tool for engineers and managers to back up reservoir simulation predictions with real science The book adds transparency and ease to the process of reservoir simulation in way never witnessed before Finally No other book provides readers complete access to the 3D 3 phase reservoir simulation software that is available with this text A must have for any reservoir engineer or petroleum engineer working upstream whether in exploration drilling or production this text is also a valuable textbook for advanced students and graduate students in petroleum or chemical engineering departments
