Dynamic Systems Modeling Simulation And Control:

Dynamic Systems Craig Allan Kluever,2020 This textbook is intended for an introductory course in dynamic systems and control typically required in undergraduate mechanical engineering and some aerospace engineering curricula Such a course is usually taken in the junior or senior year after the student has completed courses in mechanics differential equations and electrical circuits The major topics of a dynamic systems and control course include 1 mathematical modeling 2 system response analysis and 3 an introduction to feedback control systems The primary objective of this textbook is a comprehensive yet concise treatment of these major topics with an emphasis on demonstrating physical engineering applications It has been my experience that undergraduate students remain engaged in a system dynamics course when the concepts are presented in terms of real engineering systems such as a hydraulic actuator instead of academic examples This textbook is a distillation of 20 years of course notes and strategies for teaching system dynamics in the Mechanical and Aerospace Engineering Department at the University of Missouri Columbia It is thus based on my extensive classroom experience and student feedback and the end result is a text whose key features differ from current system dynamics textbooks
