Filtering the Web to Feed Data

Warehouses Witold Abramowicz, Pawel J. Kalczyński, Krzysztof Węcel, 2002-07-24. Information is a key factor in business today, and data warehousing has become a major activity in the development and management of information systems to support the proper flow of information. Unfortunately, the majority of information systems are based on structured information stored in organizational databases, which means that the company is isolated from the business environment by concentrating on their internal data sources only. It is therefore vital that organizations take advantage of external business information which can be retrieved from Internet services and mechanically organized within the existing information structures. Such a continuously extending integrated collection of documents and data could facilitate decision-making processes in the organization. *Filtering the Web to Feed Data Warehouses* discusses areas such as how to use data warehouse for filtering Web content, how to retrieve relevant information from diverse sources on the Web, how to handle the time aspect, how to mechanically establish links among data warehouse structures and documents filtered from external sources, how to use collected information to increase corporate knowledge, and gives a comprehensive example illustrating the idea of supplying data warehouses with relevant information filtered from the Web.

Building a Data Warehouse Vincent Rainardi, 2008-03-11. *Building a Data Warehouse With Examples in SQL Server* describes how to build a data warehouse completely from scratch and shows practical examples on how to do it. Author Vincent Rainardi also describes some practical issues he has experienced that developers are likely to encounter in their first data warehousing project, along with solutions and advice. The relational database management system (RDBMS) used in the examples is SQL Server; the version will not be an issue as long as the user has SQL Server 2005 or later. The book is organized as follows: In the beginning of this book, chapters 1 through 6, you learn how to build a data warehouse, for example, defining the architecture, understanding the methodology, gathering the requirements, designing the data models, and creating the databases. Then, in chapters 7 through 10, you learn how to populate the data warehouse, for example, extracting from source systems, loading the data stores, maintaining data quality, and utilizing the metadata. After you populate the data warehouse, in chapters 11 through 15, you explore how to present data to users using reports and multidimensional databases, and how to use the data in the data warehouse for business intelligence, customer relationship management, and other purposes. Chapters 16 and 17 wrap up the book. After you have built your data warehouse, before it can be released to production, you need to test it thoroughly. After

your application is in production you need to understand how to administer data warehouse operation
