characteristics *An Introduction to Generalized Linear Models* Annette J. Dobson, Adrian G. Barnett, 2018-04-17 *An Introduction to Generalized Linear Models* Fourth Edition provides a cohesive framework for statistical modelling with an emphasis on numerical and graphical methods. This new edition of a bestseller has been updated with new sections on non-linear associations, strategies for model selection, and a Postface on good statistical practice. Like its predecessor, this edition presents the theoretical background of generalized linear models (GLMs) before focusing on methods for analyzing particular kinds of data. It covers Normal, Poisson, and Binomial distributions, linear regression models, classical estimation and model fitting methods, and frequentist methods of statistical inference. After forming this foundation, the authors explore multiple linear regression, analysis of variance (ANOVA), logistic regression, log-linear models, survival analysis, multilevel modeling, Bayesian models, and Markov chain Monte Carlo (MCMC) methods. It introduces GLMs in a way that enables readers to understand the unifying structure that underpins them. It discusses common concepts and principles of advanced GLMs, including nominal and ordinal regression, survival analysis, non-linear associations, and longitudinal analysis. It connects Bayesian analysis and MCMC methods to fit GLMs. It contains numerous examples from business, medicine, engineering, and the social sciences. It provides the example code for R, Stata, and WinBUGS to encourage implementation of the methods. It offers the data sets and solutions to the exercises online. It describes the components of good statistical practice to improve scientific validity and reproducibility of results. Using popular statistical software programs, this concise and accessible text illustrates practical approaches to estimation, model fitting, and model comparisons.

*Hydrological Cycle - Volume III* Igor Alekseevich Shiklomanov, 2009-07-10 The Hydrological Cycle theme is a component of the Encyclopedia of Water Sciences, Engineering, and Technology Resources in the global Encyclopedia of Life Support Systems (EOLSS), which is an integrated compendium of twenty Encyclopedias. The Hydrological Cycle is a process of constant water exchange or water circulation in the hydrosphere, i.e., in the system of the atmosphere, Earth's surface, soil cover, upper lithosphere, to a depth of 2000 m. Water in the hydrosphere is liquid, solid, or gaseous during the hydrological cycle; it moves under the effect of heat energy, gravitation, and capillary forces, converting from a liquid to its solid state or gas and back. The hydrological cycle is one of the major geophysical processes on the planet, providing relative stability of natural conditions and continuous distribution of water between ocean, land, and atmosphere. The content of the Theme on The Hydrological Cycle is organized with state-of-the-art presentations covering several topics: Exchanges of Water in the Hydrosphere, Hydrosphere Components, World Water Balance, evaporation, Precipitation, Surface Water, Runoff, Groundwater, Hydrogeology, Glaciers, and Their Significance for the Earth, Nature, which are then expanded into multiple subtopics, each as a chapter. These four volumes are aimed at the following five major target audiences: University and College students, Educators, Professional practitioners, Research personnel, and Policy analysts, Managers, and Decision makers, and NGOs.

Probability Theory and Mathematical Statistics with Applications Wilfried Grossmann, 1988      Stochastic Modeling in Economics and Finance Jitka Dupacova, J. Hurt, J. Stepan, 2002-08-31 Unlike other books that focus only on selected specific subjects, this book provides both a broad and rich cross-section of contemporary approaches to stochastic modeling in finance and economics; it is decision-making oriented. The material ranges from common tools to solutions of sophisticated system problems and applications. In Part I, the fundamentals of financial thinking and elementary mathematical methods of finance are presented. The method of presentation is simple enough to bridge the elements of financial arithmetic and complex models of financial math developed in the later parts. It covers characteristics of cash flows, yield curves, and valuation of securities. Part II is devoted to the allocation of funds and risk management classics: Markowitz theory of portfolio capital asset pricing, model arbitrage pricing theory, asset liability management, value at risk. The method explanation takes into account the computational aspects. Part III explains modeling aspects of multistage stochastic programming on a relatively accessible level. It includes a survey of existing software links to parametric multiobjective and dynamic programming and to probability and statistics. It focuses on scenario-based problems with the problems of scenario generation and output analysis discussed in detail and illustrated within a case study. Selected examples of successful applications in finance, production planning, and management of technological processes and electricity generation are presented. Throughout, the emphasis is on the appropriate use of the techniques rather than on the underlying mathematical proofs and theories. In Part IV, the sections devoted to stochastic calculus cover also more advanced topics such as DDS Theorem or extremal martingale measures, which make it possible to treat more delicate models in Mathematical Finance: complete markets, optimal control, etc. Audience: Students and researchers in probability and statistics, econometrics, operations research, and various fields of finance, economics, engineering, and insurance.
