

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the cylinder, the combustion chamber and the valve in a cylinder or other component. These gaskets have a groove which distributes seal stress in a groove with an application on all three and high compressions used to increase the gasket. A gasket is used to maintain the pressure in a cylinder and to prevent leakage through the valve application. The gasket compresses the two components between the mating surfaces of the valve. This is done by creating a seal between the gasket and the two components between the mating surfaces. If the gasket creates a seal between the gasket and the two components through the life of the application then it is used for a gasket.

In order to determine the application requirements, the gasket designer is required to determine the gasket requirements in order to use. Every gasket application is unique and every application requires that the gasket be selected to meet the requirements of the application or the gasket is not suitable for the application.
