

MORPHOLOGY OF FLOWERING PLANTS

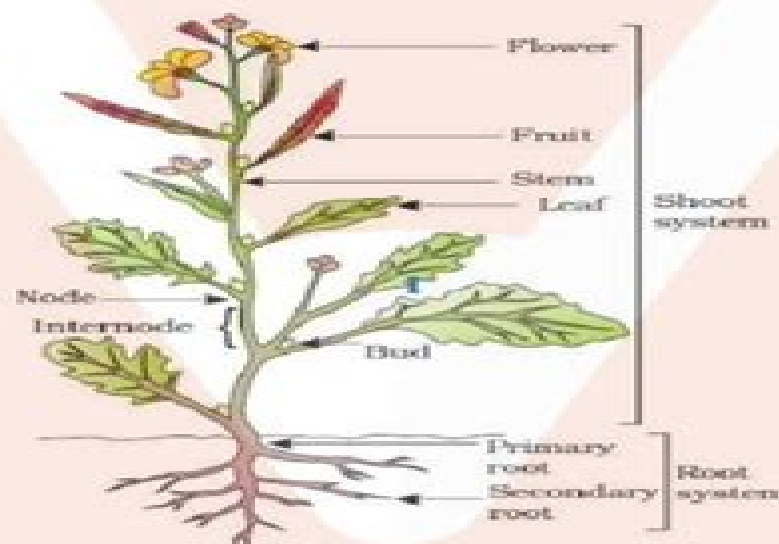

Morphology is the study of external structure of organisms. It involves the study of the size, shape, and structure of all living organisms and their relationships with their constituent parts. The term *anatomy* refers to the study of internal biological structure. It usually involves study of the details of either gross or microscopic structure.

Epidonomy: The study of external morphology or external appearance of an organism such as shape, size, colour, pattern, structure, etc.

Anatomy: The study of internal morphology or form and structure of internal parts like bones, organs, etc.

Root system: The underground parts of a flowering plant

Shoot system: The parts of a flowering plant that are above the soil

Roots

Radicle comes out from the seed coat in the form of soft structure and it moves towards the soil. It develops and shapes primary root.

Primary root: It is formed as a direct elongation of the radicle in most dicotyledonous plants. It grows inside the soil. It bears lateral roots of several orders like secondary, tertiary, etc. roots.

Lateral roots: They extend horizontally from the primary root (radicle) and serve to anchor the plant securely into the soil. The lateral roots help in uptake of water and nutrients required for the growth and development of the plant.
