Chapter 4

Science in context

Floating a paper clip on water is a simple exercise that has links to both Biology and Physics. You may wish to organise learners into groups which include those taking Biology and Physics as well as Chemistry. Some learners may need hints to help them answer the questions but there is sufficient information at the beginning of the passage to help them.

Suggested hints could include:

- pressure = force divided by area
- spongy surfaces absorb water
- what happens when you add cooking oil to vinegar?
- hairs on feet/legs could trap air

Skating insects have wide feet because a larger surface area means there is less downward pressure on the water surface for the same mass. The lower the pressure on the water surface, the less likely it is that the feet of the insects will go through the surface.

Learners might suggest oils of various types, e.g. cooking oil.

A soft layer such as paper will absorb water and so drag the insect into the water.

For the insect design, learners could draw their perfect insect and present it to the class. This could be done as a group activity. Things that they might incorporate could include:

- very light mass so the force per unit area on the surface of the water is minimised
- long legs and narrow body so the downforce is spread over a wider area
- legs which are flexible (have very good joints) so that the weight is evenly distributed
- hard surface on feet and legs so water is not absorbed

- smooth surface on bottoms of feet so insects can slide easily (but see also the next suggestion)
- hairs on feet/legs to trap bubbles of air if the legs go below the surface (to buoy them up again)
- grooved feet to trap air, which will increase buoyancy
- they may also suggest that an oily surface on the feet will help reduce attractions between the water and the surface of the insect's body.

Starikov, 2019-04-01 Modern thermodynamics is a unique but still not a logically self consistent field of knowledge It has a proven universal applicability and significance but its actual potential is still latent The development of the foundations of thermodynamics was in effect non stop but absolutely no one has any idea about this This book is the first of its kind that will motivate researchers to build up a logically consistent field of thermodynamics It greatly appreciates the actual depth and potential of thermodynamics which might also be of interest to readers in history and philosophy of scientific research The book presents the life stories of the protagonists in detail and allows readers to cast a look at the whole scene of the field by showcasing a significant number of their colleagues whose works have fittingly complemented their achievements It also tries to trigger a detailed analysis of the reasons why the actual work in this extremely important field has in effect gone astray It comprises five chapters and introduces three scientists in the first two chapters which are specifically devoted to the Scandinavian achievements in macroscopic thermodynamics These introductions are novel and call for a detailed reconsideration of the field The third chapter acquaints the readers with their fourth colleague in Germany who was working on the proper link between the macroscopic thermodynamics kinetics and the atomistic representation of matter The fourth chapter brings in their fifth colleague in the United States who could formally infer the famous formula $S = k \ln W$ ingeniously guessed by Ludwig Boltzmann and thus clarify the physical sense of the entropy notion The last chapter summarizes the above mentioned discourses Glencoe Algebra 1, 2001 **Working with the Brain in Psychology** Lynn A.
