Polymères À Empreintes Moléculaires Et Nano-composites Par Polymérisation Radicalaire Et Radicalaire Contrôlée ,2010 This thesis is organized in three chapters and is based on three published papers and two manuscripts about to be submitted Molecularly imprinted polymers MIPs are tailor made synthetic receptors that are obtained by polymerization in the presence of a molecular template The first paper describes the use of Raman spectroscopy to detect and quantify the presence of the imprinting template in single molecularly imprinted polymer microspheres The polymers were imprinted with the Beta blocking drugs propranolol and atenolol and precipitation polymerization was used to obtain spherical particles The nanoparticles were used for bulk detection whereas with micrometer sized particles quantitative measurements on single particles were possible Relatively low detection limits down to 1 M have been reached for the detection of S propranolol through bulk measurements on MIP nanoparticles The second paper describes chemical nanosensors with a submicron core shell composite design based on a polymer core a molecularly imprinted polymer MIP shell for selective analyte recognition and an interlayer of gold nanoparticles for signal amplification SERS measurements on single nanosensors yielded a detection limit of 10^{-7} M for the Beta blocker propranolol several orders of magnitude lower than on plain MIP spheres These particles were also used as sensor materials with localized surface plasmon resonance measurements as the transduction method Paper III for the determination of the Beta blocking drug propranolol The sensors were used in suspension and were measured using a standard UV Vis spectrophotometer In order to solve general problems associated with MIPs in particular their heterogeneity in terms of inner morphology and distribution of binding site affinities it has been suggested to use modern methods of controlled living radical polymerization for their synthesis This also facilitates their generation in the form of nanomaterials nanocomposites and thin films a strong recent trend in the field The fourth paper reviews recent advances in the molecular imprinting area with special emphasis on the use of controlled polymerization methods their benefits and current limitations In the last paper we have for the first time used a recently

developed CRP method based on iodide mediated polymerization reversible chain transfer catalyzed polymerization RTCP for the synthesis of MIPs We show on the example of MIPs specific for the Beta blocking drug propranolol that RTCP is compatible with MIP synthesis both for the synthesis of bulk polymers and nanospheres and that it yields polymers with the same binding capacity as the standard FRP method used for comparison Solid state NMR measurements revealed that the conversion of pendant vinyl groups was higher with RTCP than with polymers synthesized by FRP in particular at higher initiator concentrations

Reversible Addition-fragmentation Chain-transfer (RAFT) Polymerization in Grafting Polymer Chains from TiO₂ Nanoparticles Joseph Robert Lott,2006 A phosphonate coupling molecule containing a vinyl double bond was synthesized and anchored onto the surface of TiO₂ nanoparticles Diffuse reflectance infra red DRIFT spectroscopy confirmed the presence of the coupling molecule on the particulate surface while thermogravimetric analysis revealed the coupling molecule covered 28% of the surface Methyl methacrylate was free radically polymerized through the immobilized vinyl bond on the surface in the presence of the reversible addition-fragmentation chain transfer RAFT agent 4 cyanopentanoic acid dithiobenzoate using 2,2 azobisisobutyronitrile AIBN as an initiator DRIFT measurements confirmed the presence of methacrylate groups on the surface Differential scanning calorimetry detected a weak glass transition for poly methylmethacrylate at 65°C Thermogravimetric analysis found that grafted PMMA accounted for 1.2% of the particle's mass In addition a synthetic route was developed for a novel phosphonatedithioester coupling molecule with progress made towards its synthesis Abstract Metal-Catalyzed Polymerization Samir Chikkali,Ashootosh V.
