Tou, 2012-12-06 Engineering has long been thought of by the public as a profession traditionally categorized into such branches as electrical mechanical chemical industrial civil etc This classification has served its purpose for the past half century but the last decade has witnessed a tremendous change A continuous transition from the practical to the theoretical has made technology overlap with science and the enlargement of scope and broad ened diversification have smeared the boundaries between traditional engineering and scientific fields Engineering is rapidly becoming a diversified multidisciplinary field of scientific endeavor This has prompted us to regard modern engineering as a science which has as its ingredients materials energy and information In our complex and technologically oriented society organizations are flooded with an enormous amount of management information We are now faced with problems concerning the efficient use of communicated knowledge The steady growth in the magnitude and complexity of information systems necessitates the development of new theories and techniques for solving these information problems We demand instant access to previously recorded information for decision making and we require new methods for analysis recognition processing and display As a consequence information science has evolved out of necessity Concerned with the theoretical basis of the organization control storage retrieval processing and communication of information both by natural and artificial systems information science is multidisciplinary in character It covers a vast area of subject matter in the physical and biological sciences

### **Parallel Logic Programming** Evan Tick,1991 Highly parallel machines have been available for many years but because advances in hardware have always outpaced progress in software development

designers and users of these machines have yet to realize their full potential Until recently there have been few if any high class parallel programming languages that could be implemented on the wide variety of parallel processing systems in use This book helps to redress the balance by teaching programming techniques as well as performance analysis of parallel programming languages and architectures using logic programming specifically it focuses on the Prolog like languages OR parallel Prolog and AND parallel FGHC Parallel Logic Programming brings to light practical applications of a previously esoteric theoretical area of parallel logic programming and is unique in presenting programming hand in hand with performance analysis of real empirical measurements Its quantitative approach to symbolic parallel programming provides students and professionals with tools for implementing and critically evaluating larger projects The book includes useful chapter summaries programming projects and a glossary
