Continuous and Discrete-Time Signals and Systems Athanasios I. Margaris, 2025-08-30 This textbook provides a detailed study of continuous and discrete time signals and systems at a theoretical as well as a practical level for undergraduate as well as graduate students The book follows a didactic approach allowing the students to acquire a solid knowledge and skill required for the study of more advanced subjects such as telecommunications as well as automatic control systems The detailed presentation of the theory in this book is accompanied by many examples as well as hundreds of solved and unsolved exercises that help the reader to gain immediately a deep

understanding of the presented material and the way it is used in practice Because of the mathematical complexity associated with the presented material this book requires a good knowledge of basic concepts from linear algebra and mathematical analysis such as for example elements of matrix theory the concepts of the derivative and the integral as well as the knowledge of the main aspects associated with differential and difference equations for the continuous and the discrete time domain respectively Special emphasis should also be given to well known techniques that allow the estimation of the inverse transforms such as polynomial division partial fractions expansion as well as the methods of residues for the estimation of integrals of complex functions

Federated Learning Mei Kobayashi,2025-08-01 This book serves as a primer on a secure computing framework known as federated learning Federated learning is the study of methods to enable multiple parties to collaboratively train machine learning AI models while each party retains its own raw data on premise never sharing it with others This book is designed to be accessible to anyone with a background in undergraduate applied mathematics It covers the basics of topics from computer science that are needed to understand examples of simple federated computing frameworks It is my hope that by learning basic concepts and technical jargon from computer science readers will be able to start collaborative work with researchers interested in secure computing Chap 1 provides the background and motivation for data security and federated learning and the simplest type of neural network Chap 2 introduces the idea of multiparty computation MPC and why enhancements are needed to provide security and privacy Chap 3 discusses edge computing a distributed computing model in which data processing takes place on local devices closer to where it is being generated Advances in hardware and economies of scale have made it possible for edge computing devices to be embedded in everyday consumer products to process large volumes of data quickly and produce results in near real time Chap 4 covers the basics of federated learning Federated learning is a framework that enables multiple parties to collaboratively train AI models while each party retains control of its own raw data never sharing it with others Chap 5 discusses two attacks that target weaknesses of federated learning systems 1 data leakage i e inferring raw data used to train an AI model by unauthorized parties and 2 data poisoning i e a cyberattack that compromises data used to train an AI model to manipulate its output
